

Description of Additional Supplementary Files

File name: Supplementary Data 1

Description: The heritability of and genetic correlations across 86 traits in 20,190 unrelated 'white British' individuals from the UK Biobank as estimated using MGREML (relative volumes).

File name: Supplementary Data 2

Description: The heritability of and genetic correlations across 86 traits in 20,190 unrelated 'white British' individuals from the UK Biobank as estimated in a pairwise (bivariate) approach using MGREML (relative volumes). Each h^2 (and its standard errors) reflects the average estimate from 85 pairwise analyses.

File name: Supplementary Data 3

Description: The heritability of and genetic correlations across 86 traits in 20,190 unrelated 'white British' individuals from the UK Biobank as estimated using MGREML (absolute volumes).

File name: Supplementary Data 4

Description: The heritability of and genetic correlations across 86 traits in 20,190 unrelated 'white British' individuals from the UK Biobank as estimated using LDSC (relative volumes). Reference sample for LDSC: 1000 Genomes (Europeans).

File name: Supplementary Data 5

Description: The heritability of and genetic correlations across 86 traits in 20,190 unrelated 'white British' individuals from the UK Biobank as estimated using LDSC (relative volumes). Reference sample for LDSC: UK Biobank (Europeans).

File name: Supplementary Data 6

Description: The heritability of and genetic correlations across 86 traits in 20,190 unrelated 'white British' individuals from the UK Biobank as estimated using MGREML (relative volumes). LDAK-Thin GRM.

File name: Supplementary Data 7

Description: The heritability of and genetic correlations across 86 traits in 20,190 unrelated 'white British' individuals from the UK Biobank as estimated using SumHer (relative volumes). Reference sample for SumHer: UK Biobank (GBR tagging file).

File name: Supplementary Data 8

Description: The average heritability (and standard error) of 86 traits as estimated in 20,190 unrelated 'white British' individuals from the UK Biobank using different heritability models.
