

Appendix I

1. PCA loadings plots showing the distribution of components for raw and complete datasets for different days of culture. In figures 1 to 4, X axis shows PC1 and Y axis shows PC2, where PC1 and PC2 are the first two PCA components. Orange dots represents raw dataset and blue dots represents complete dataset. Axes have no units. Plot number in each figure corresponds to the day of culture. Percentage variance explained by each component for each day is provided in table 1 at the end.

Parameters are assigned alphabets to enable visualisation. Culture Days - A; ECT - B; VCD - C; TCD - D; ACC - E; ACD - F; pH - G; [Glutamine] - H; [Glutamate] - I; EGN - J; ACV - K; [Lactate] - L; [NH₃] - M; Osmolality - N; [Glucose] - O; CPDL - P; [Na⁺] - Q; [K⁺] - R; [HCO₃⁻] - S; Temperature - T; pCO₂ - U; pO₂ - V.

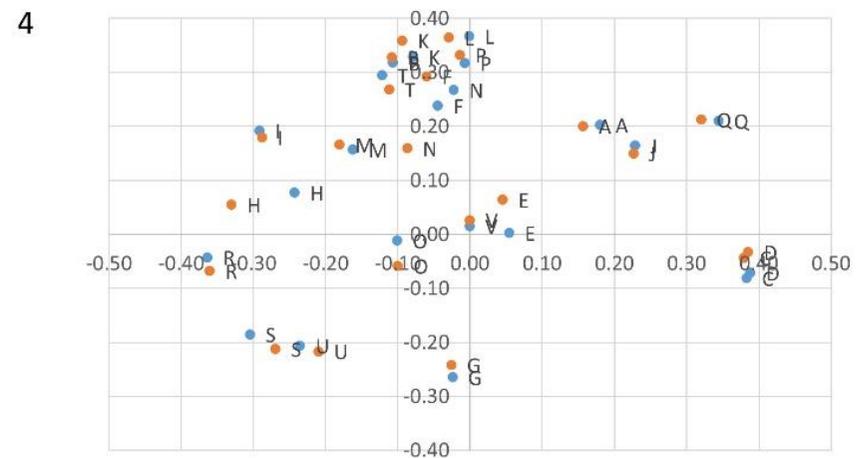

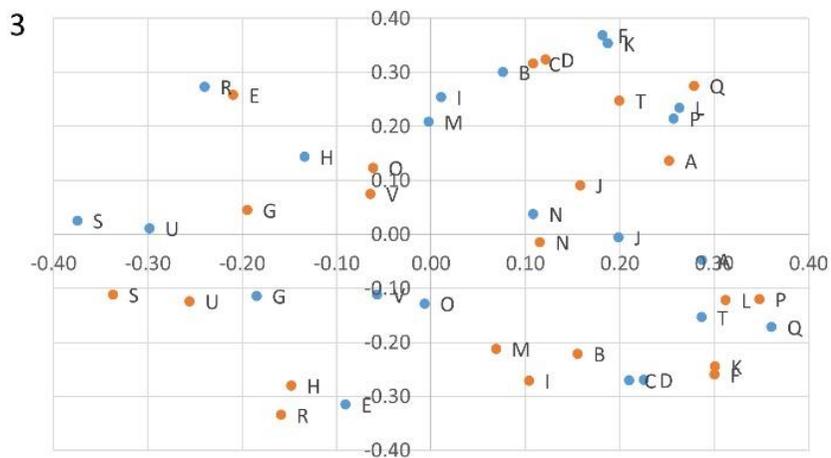

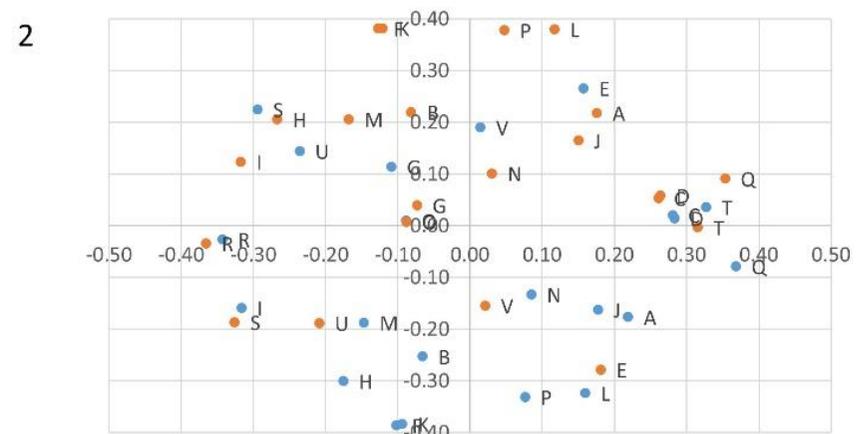

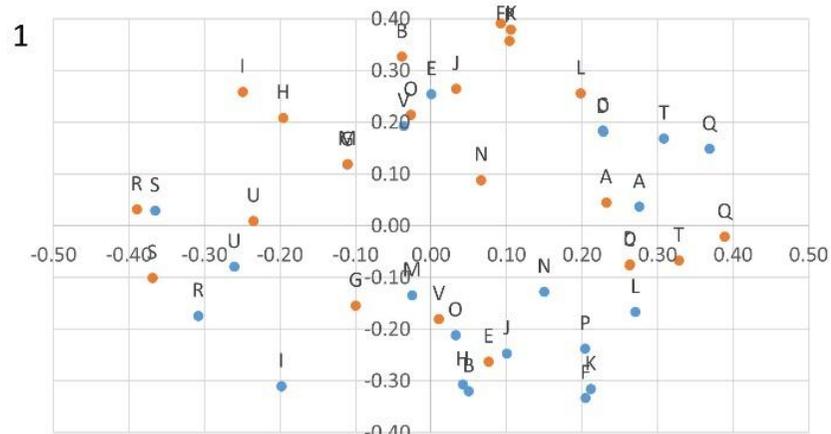

Figure 1: PCA loadings plot for Days 1, 2, 3 and 4 of the culture. Refer to the explanation above to interpret results.

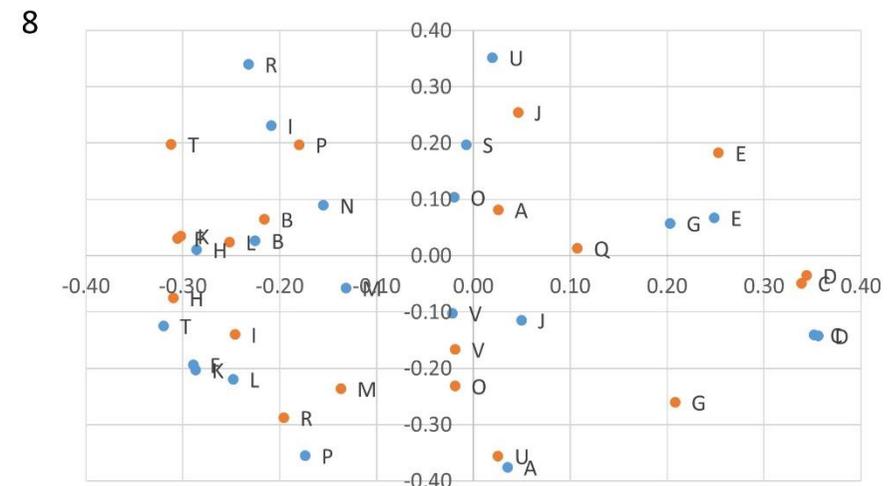

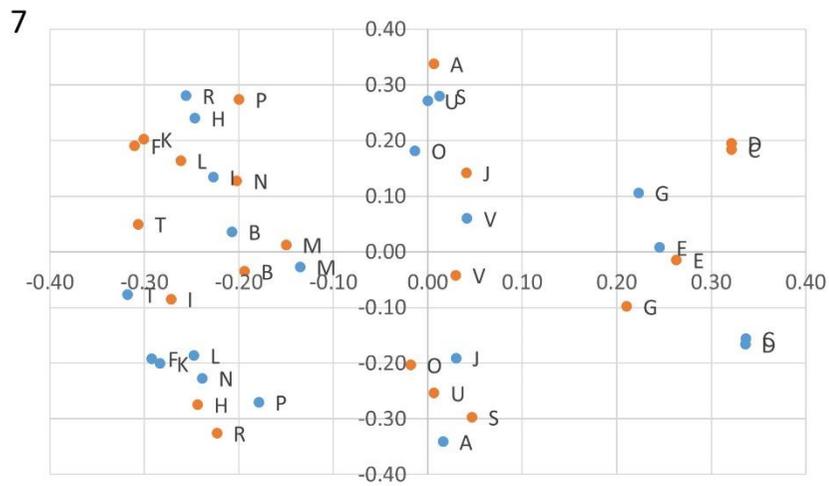

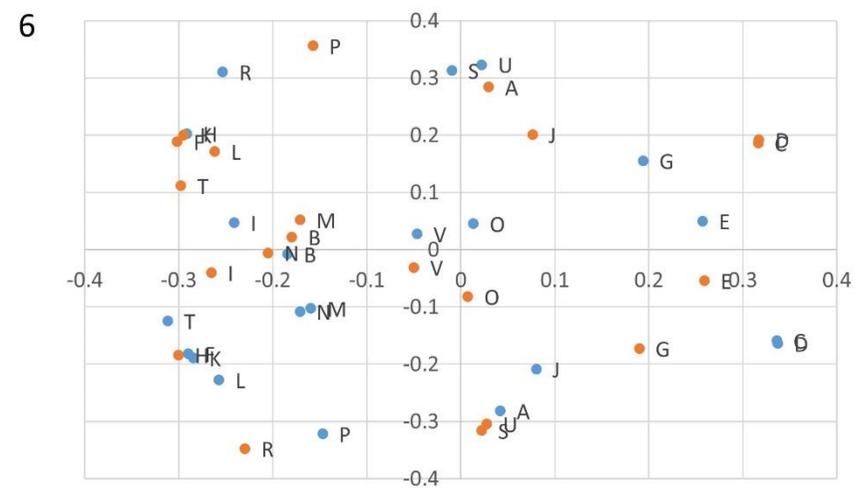

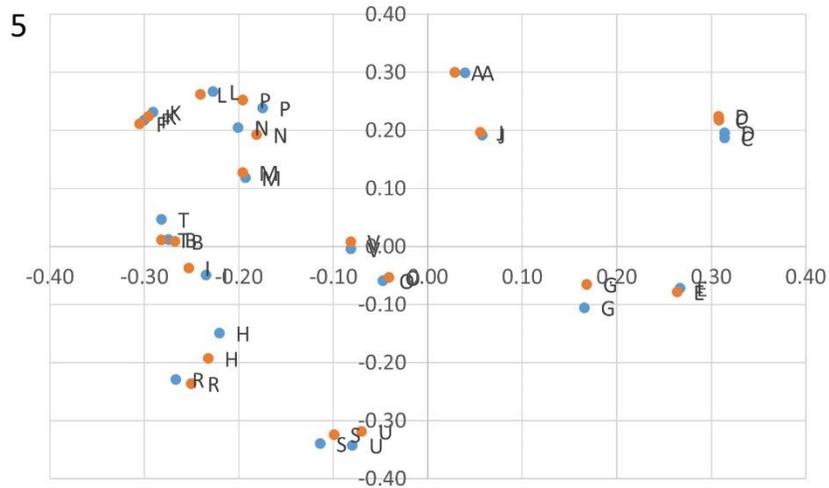

Figure 2: PCA loadings plot for Days 5, 6, 7 and 8 of the culture. Refer to the explanation above to interpret results.

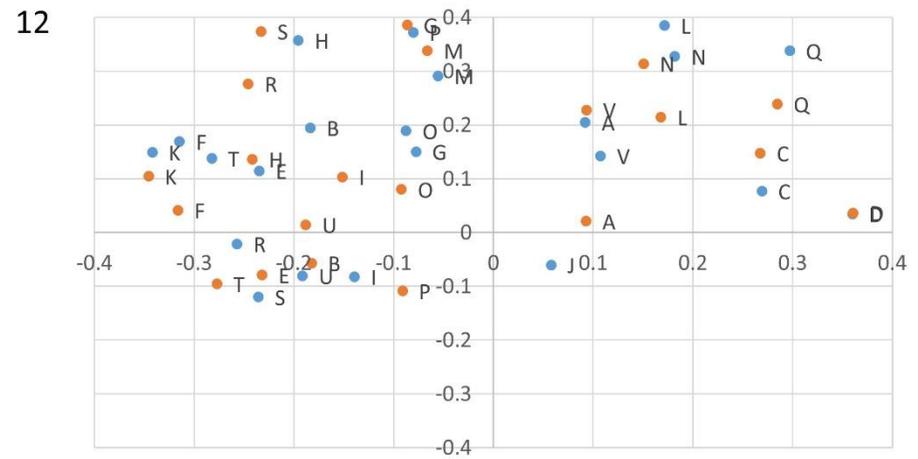

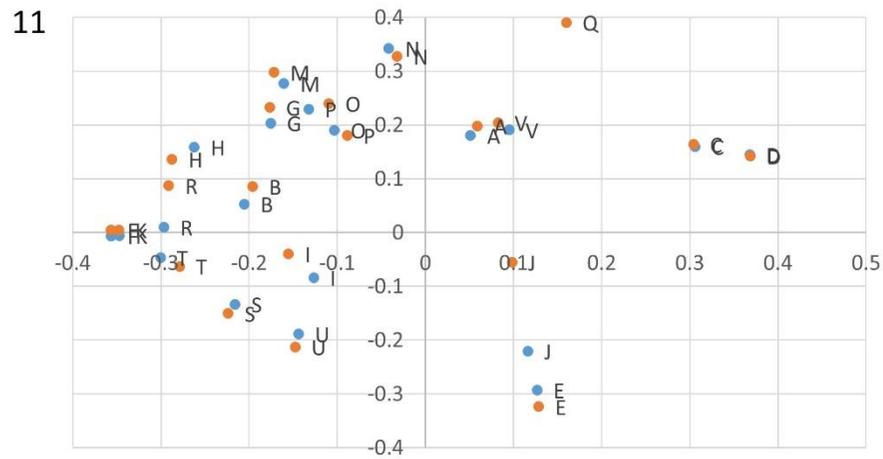

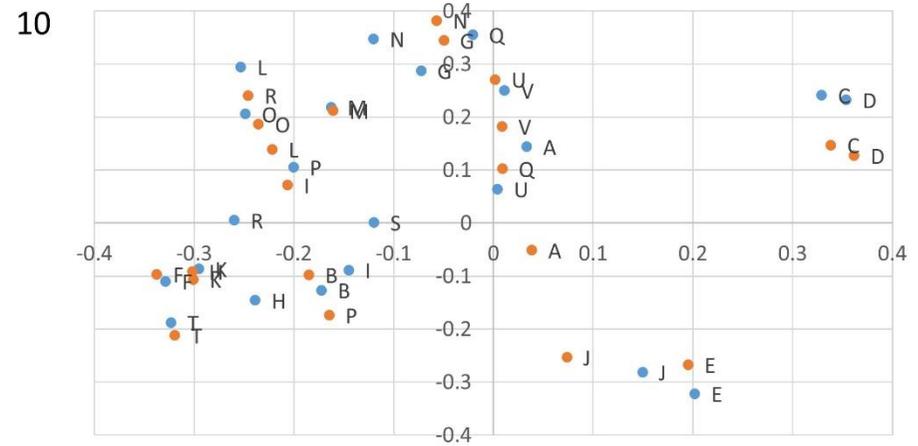

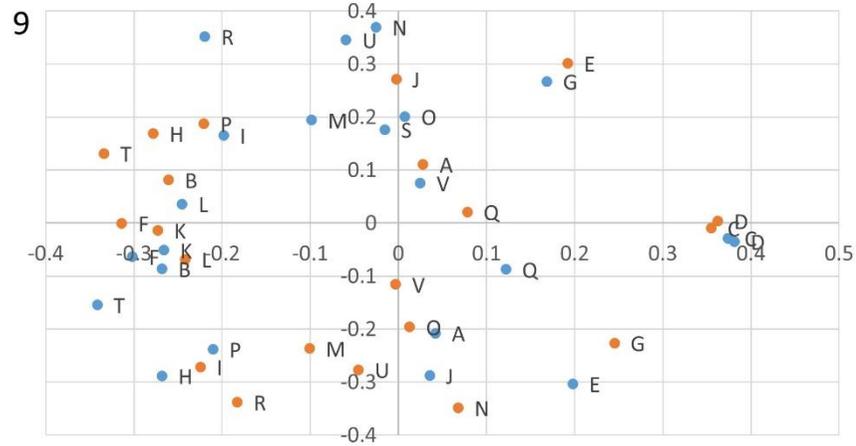

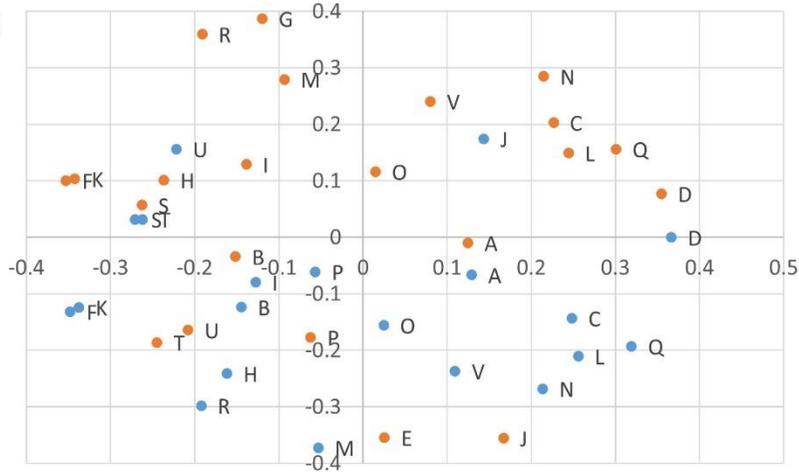

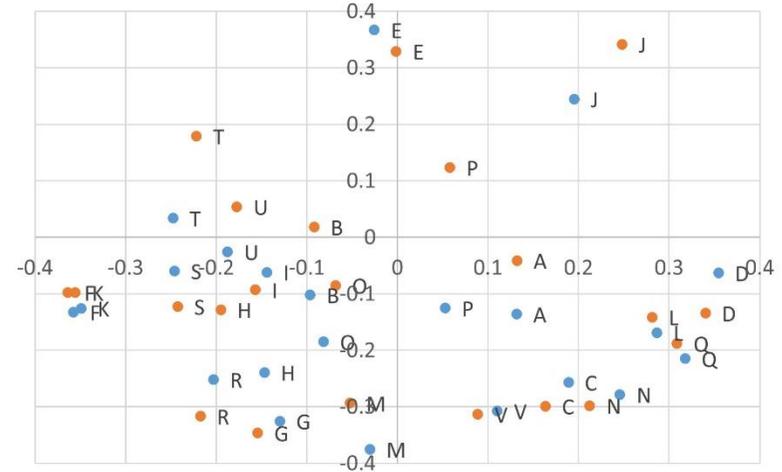

Figure 3: PCA loadings plot for Days 9, 10, 11 and 12 of the culture. Refer to the explanation above to interpret results.

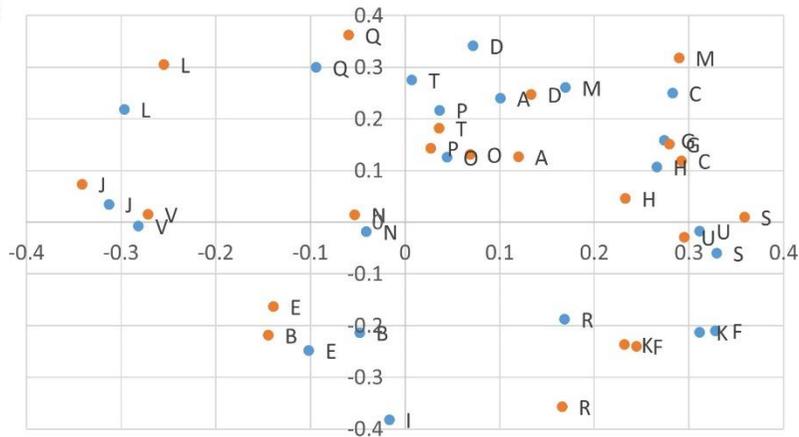

13

14

15

16

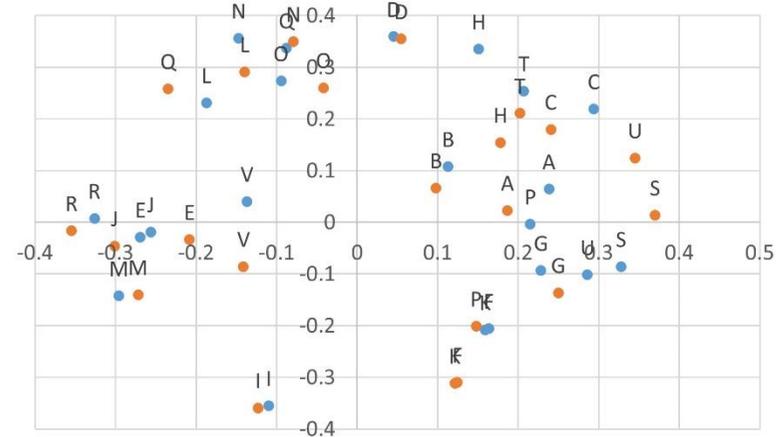

Figure 4: PCA loadings plot for Days 13, 14, 15 and 16 of the culture. Refer to the explanation above to interpret results.

Table 1: Table showing percentage variance explained by each component on each day of the culture.

| Day | Percentage Variance Explained | | | |
|-----|-------------------------------|--------|-------------|--------|
| | Complete Dataset | | Raw Dataset | |
| | PC1 | PC2 | PC1 | PC2 |
| 1 | 23.600 | 21.700 | 26.200 | 22.700 |
| 2 | 27.800 | 20.200 | 30.100 | 19.900 |
| 3 | 24.200 | 20.600 | 25.700 | 23.400 |
| 4 | 22.900 | 20.200 | 23.500 | 20.900 |
| 5 | 27.800 | 17.700 | 29.400 | 18.400 |
| 6 | 29.100 | 14.900 | 30.800 | 15.600 |
| 7 | 30.000 | 14.800 | 30.900 | 15.500 |
| 8 | 28.600 | 14.000 | 30.200 | 15.600 |
| 9 | 26.000 | 15.100 | 27.800 | 18.100 |
| 10 | 25.500 | 17.200 | 26.300 | 19.200 |
| 11 | 25.400 | 18.400 | 26.300 | 17.200 |
| 12 | 25.500 | 15.400 | 26.200 | 13.700 |
| 13 | 27.000 | 15.000 | 28.700 | 16.700 |
| 14 | 27.100 | 15.700 | 28.500 | 16.900 |
| 15 | 27.300 | 17.400 | 30.200 | 20.300 |
| 16 | 35.600 | 23.000 | 36.800 | 19.700 |

2. Tables showing distance of each parameter from the origin for different days of culture. P1 and P2 represents the weights of parameter in the 1st and 2nd components respectively. Hypotenuse is the distance of the parameter from the origin on a Cartesian plane. The column 'Distance' is the distance between corresponding parameters in raw and complete datasets on a Cartesian plane.

Table 2: Table showing proximity in the distribution of values for raw and complete datasets for Day 0 of the culture. Refer to description above for interpreting the table.

| Day 0 Parameters | Complete | | | Raw | | | Raw - Complete |

3. Table showing bandwidth calculation of the spread of parameter values on a Cartesian plane as identified from PCA loadings. 'Range of Loadings' columns describes the spread of values of all the parameters for each day in the culture for raw and complete datasets. Distances are measured from the origin. The row 'Range' is calculated as the difference between overall maximum and minimum, and explains the width of upper and lower bounds. The row 'midpoint' attempts to find a midpoint in the upper and lower bounds by taking the average of the overall minimum and maximum values. Bandwidth is calculated as the difference between the midpoints of overall maximum and minimum values.

Table 19: Table showing the spread of parameters on a Cartesian plane for complete and raw datasets.

| Days | Range of Loadings | | | |
|-----------------|-------------------|-------|----------|-------|
| | Complete Data | | Raw Data | |
| | Min | Max | Min | Max |
| 0 | 0.000 | 0.523 | 0.000 | 0.627 |

Appendix II

1. Heat maps from 'mvtsplot' function in R showing different parameter behaviour at different time points across 106 cultures. Purple depicts low values, grey - medium, and green - high values. Colours are not comparable across cultures. Right hand side panel has box plots of the data in each time-series and on the bottom panel are the median values across all time-series for each time point.

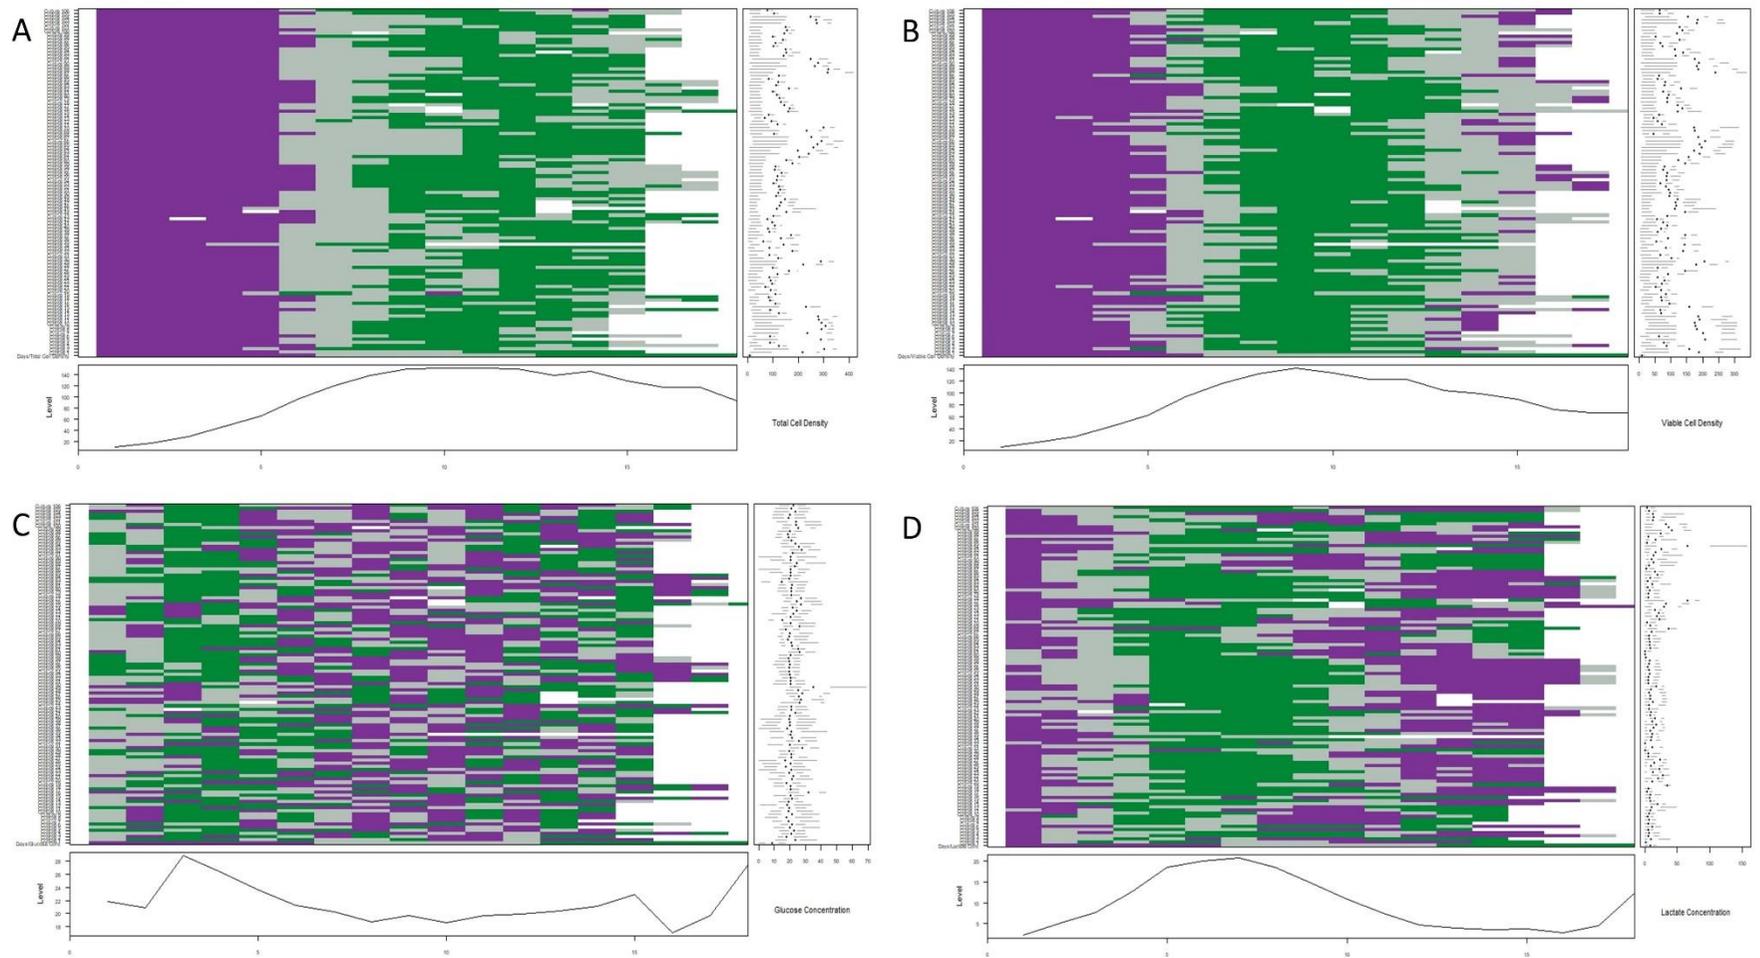

Figure 1: Heat maps of (A) TCD (B) VCD (C) [Glucose] (D) [Lactate]. Refer to the explanation above for interpretation.

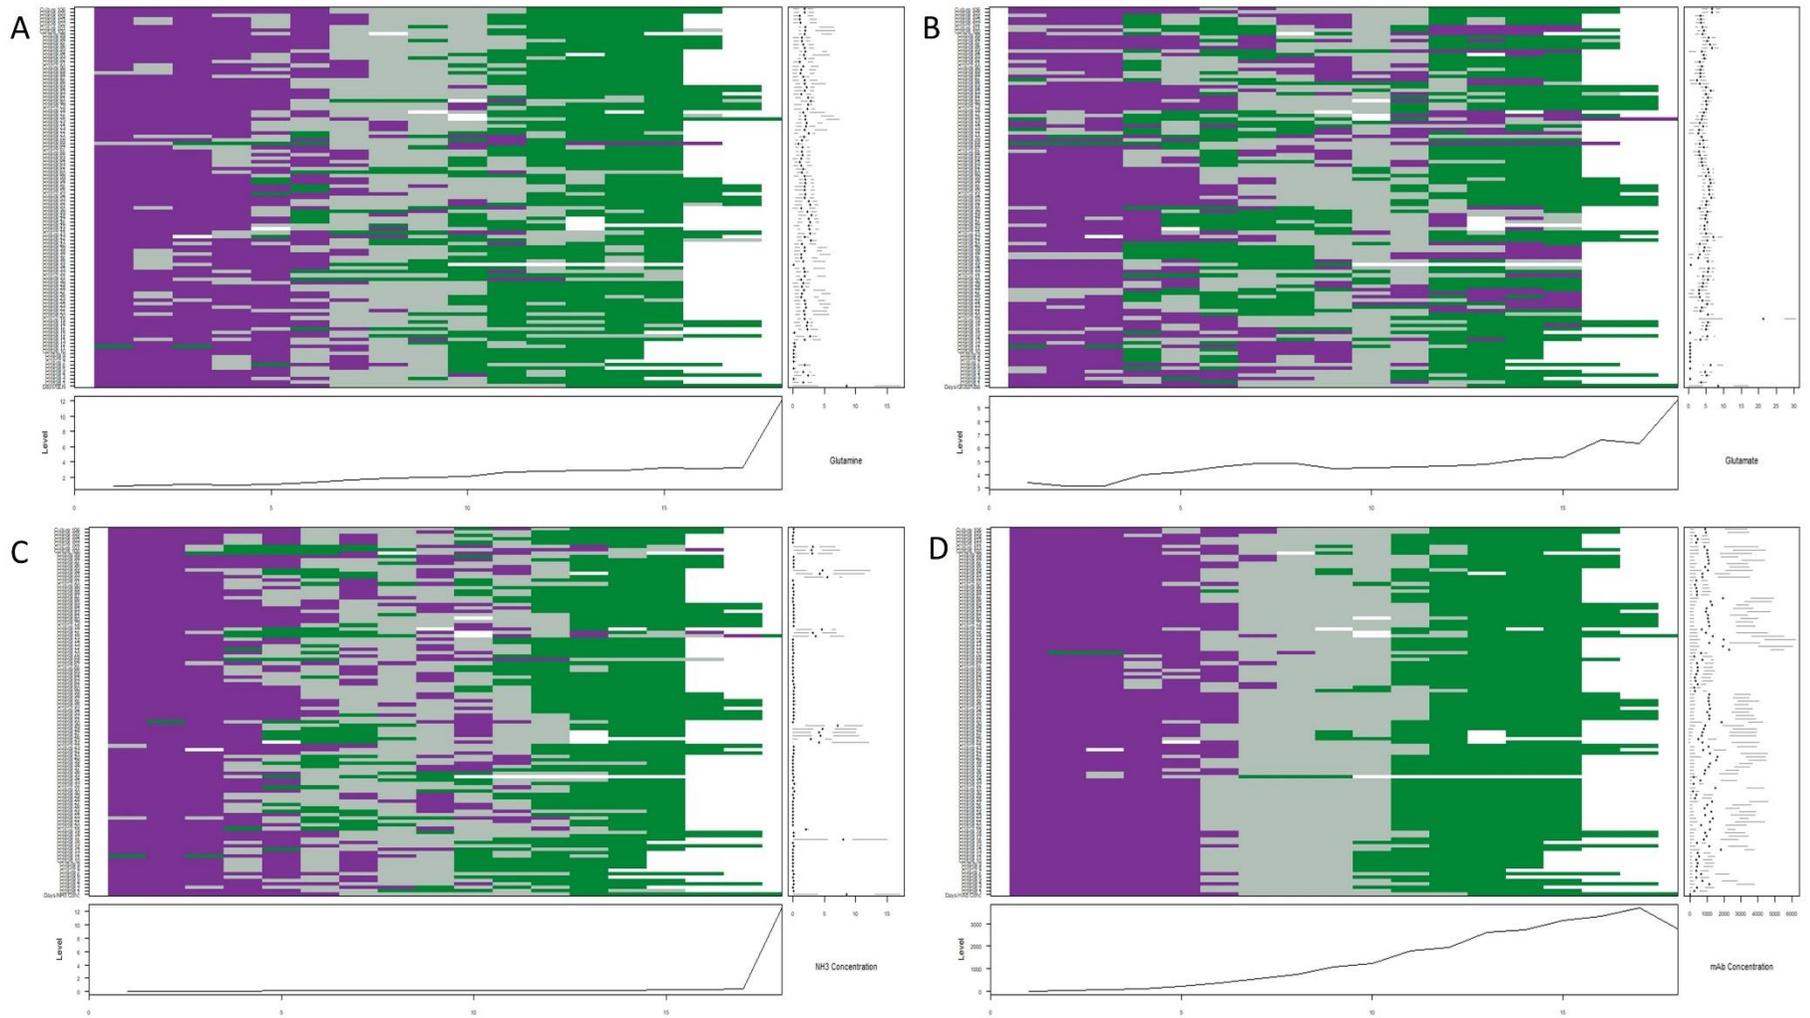

Figure 2: Heat maps of (A) [Glutamine] (B) [Glutamate] (C) [NH₃] (D) [mAb]. Refer to the explanation above for interpretation.

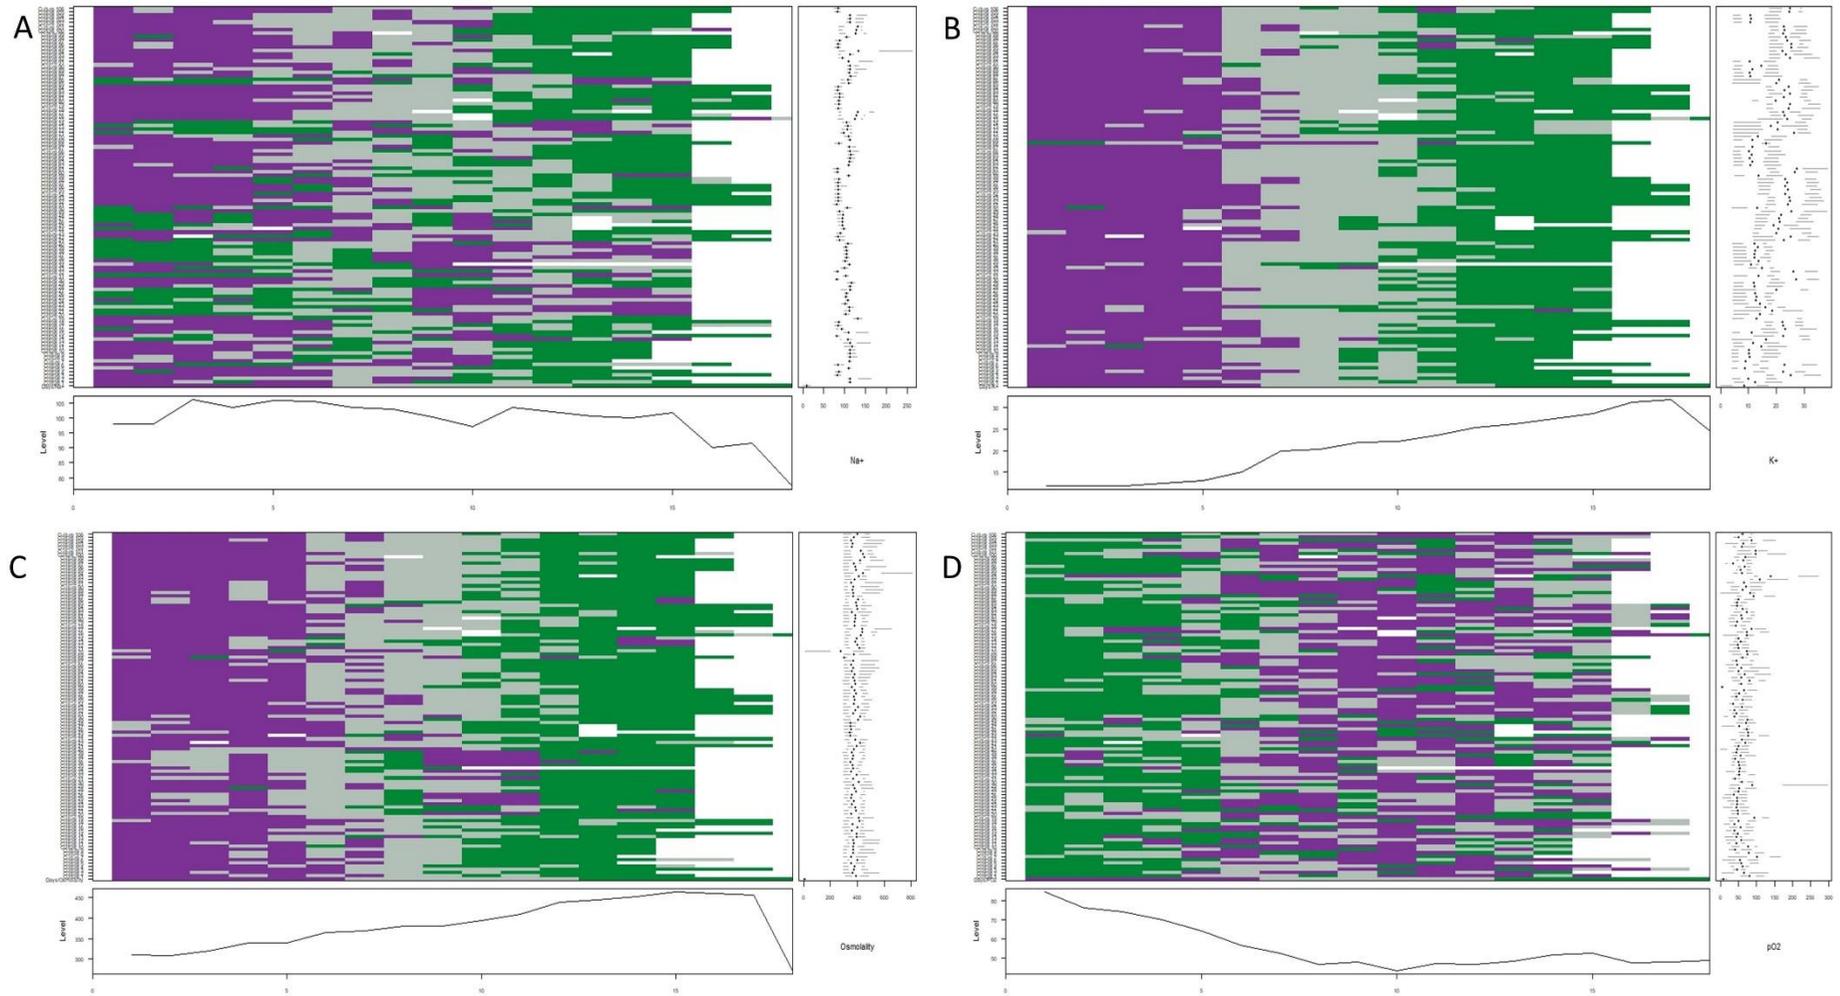

Figure 3: Heat maps of (A) [Na+] (B) [K+] (C) Osmolality (D) [pO₂]. Refer to the explanation above for interpretation.

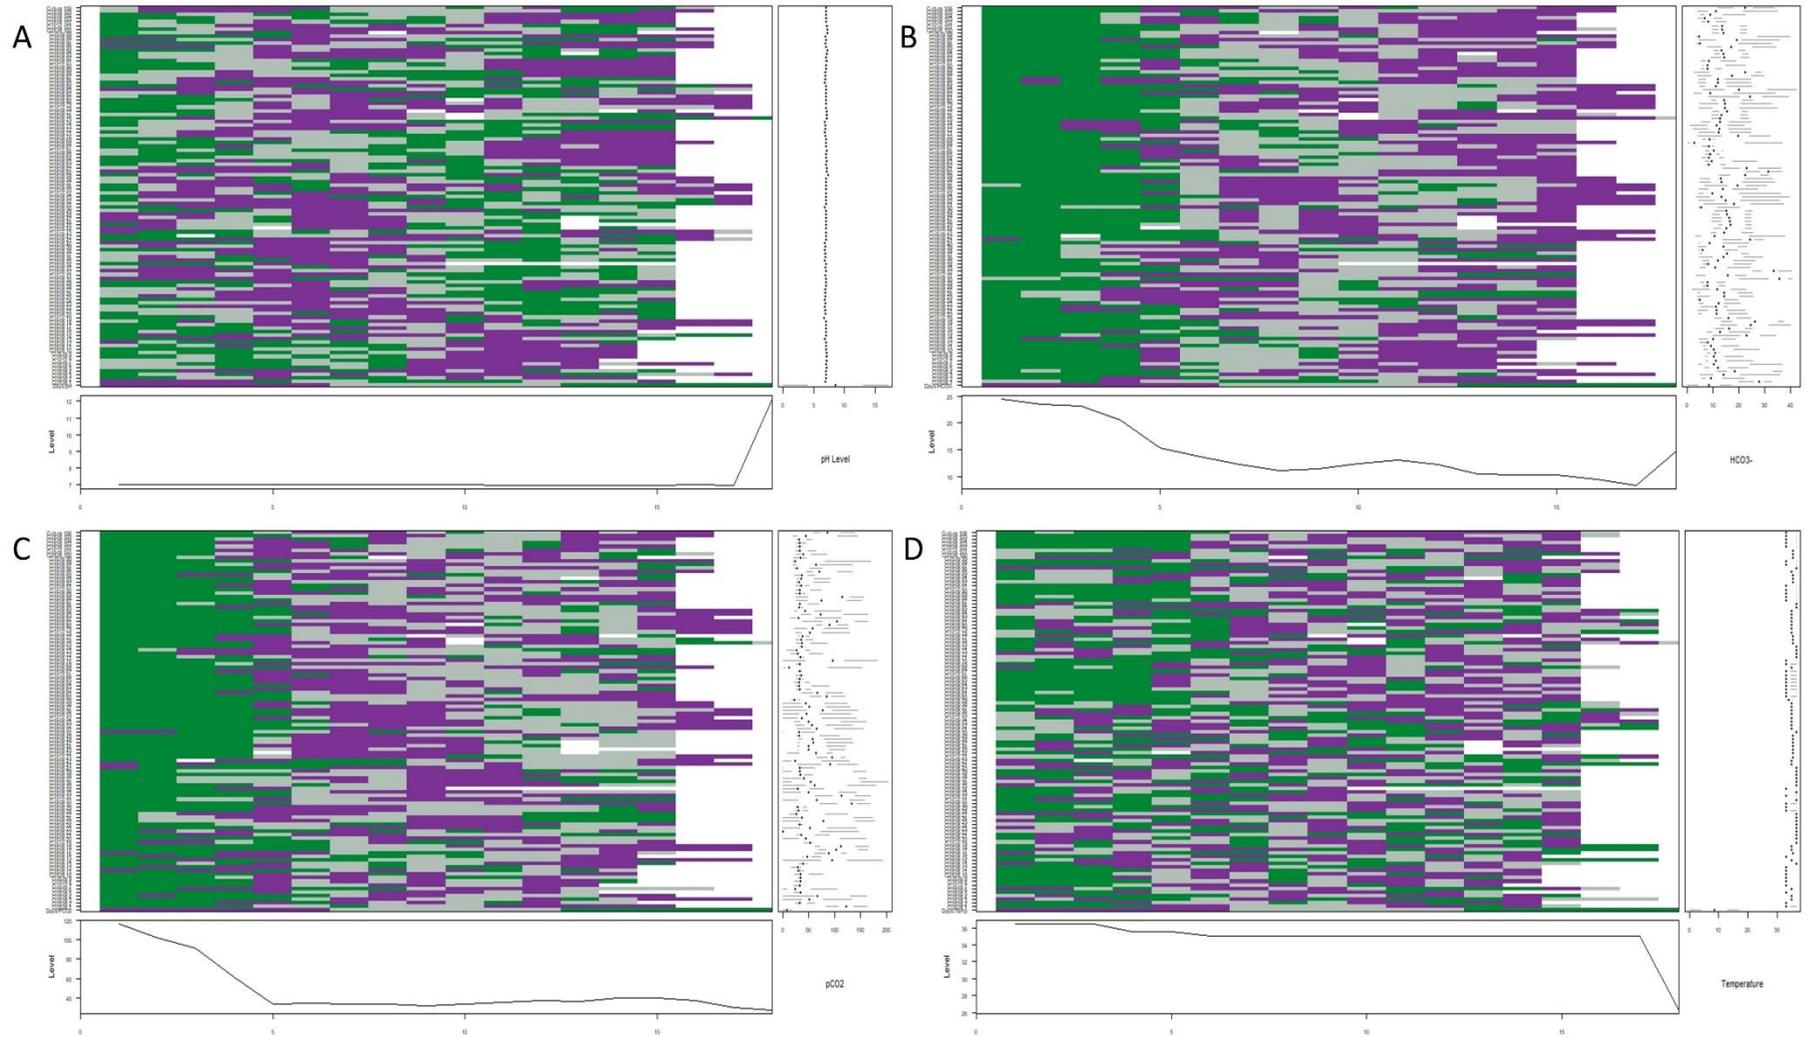

Figure 4: Heat maps of (A) pH (B) [HCO₃⁻] (C) [pCO₂] (D) Temperature. Refer to the explanation above for interpretation.

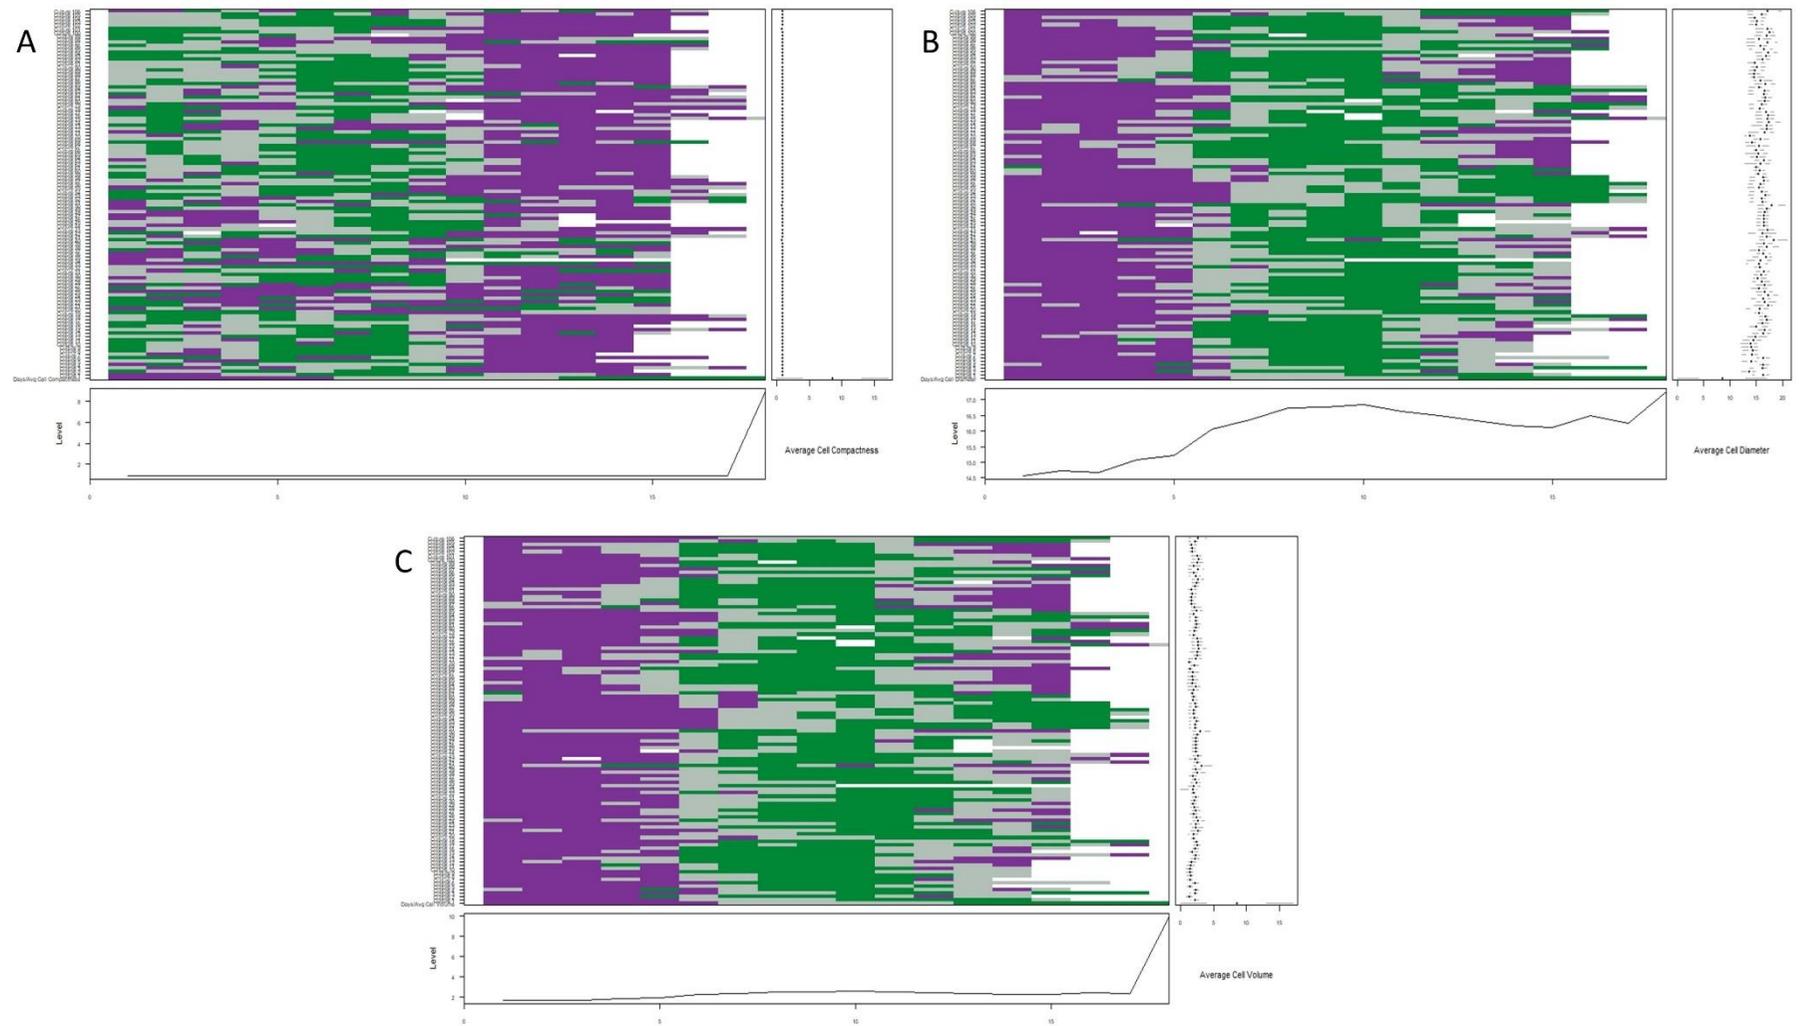

Figure 5: Heat maps of (A) ACC (B) ACD (C) ACV. Refer to the explanation above for interpretation.

Appendix III

1. Outputs from different stages of clustering for different days of culture. In figures 1 to 15 (A) Dendrogram showing parameter clustering. Scale on the left hand side shows the number of clusters formed at different heights of the dendrogram. Number of parameters in each cluster increases, moving from bottom to top of the dendrogram. (B) Plot showing aggregation level at different heights of dendrogram. X axis shows the number of clusters and Y axis shows the height of dendrogram in centimetres. More parameters cluster moving from bottom to top on Y axis. (C) Plot showing stability of partition while cutting the dendrogram into different clusters. Moving from left to right on X axis, stability increases. Adjusted RAND index has no units. (D) Plot showing dispersion of adjusted RAND index. X axis shows number of clusters and Y axis shows adjusted RAND index. Axes have no units. (E) Dendrogram showing parameters of the same cluster in same colour. These are the most stable clusters from the analyses. Scale on the left hand side shows the number of clusters formed at different heights of the dendrogram.

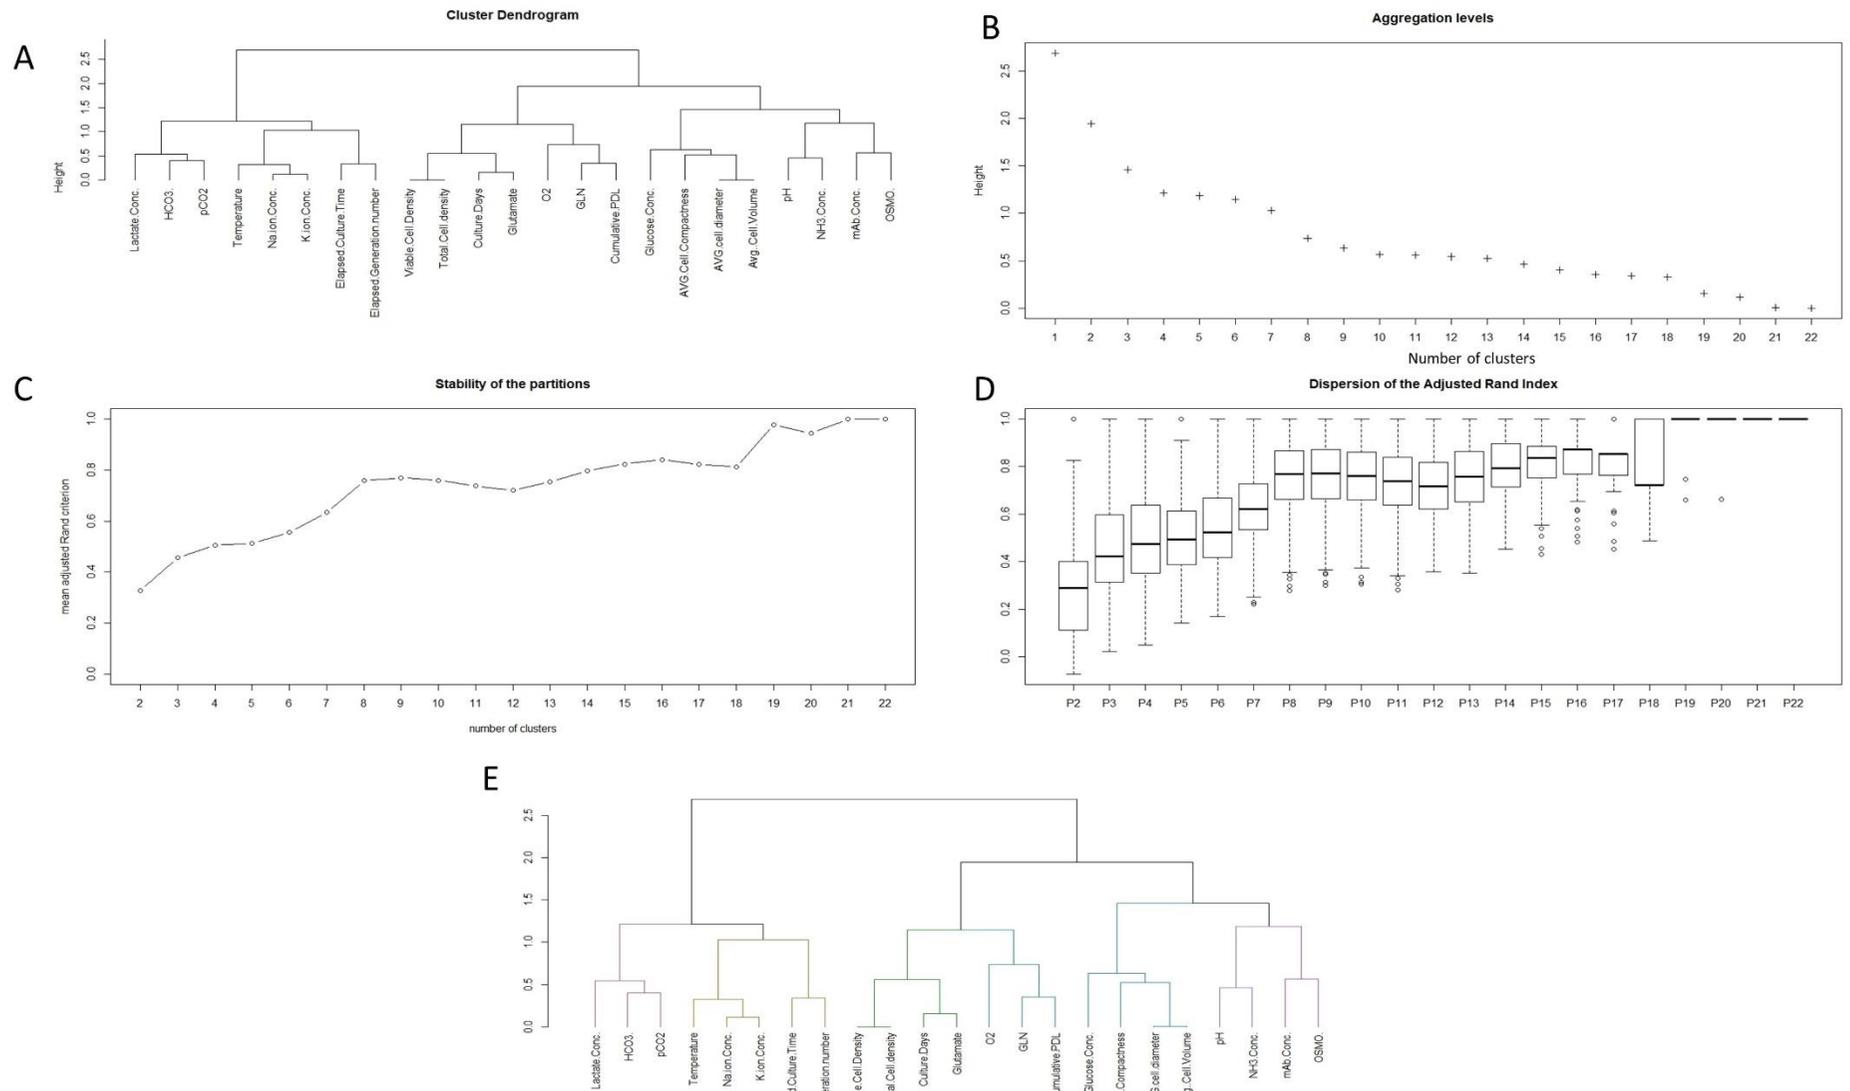

Figure 1: Clustering results for Day 1. Refer to the explanation above for interpretation.

- Heat maps showing similarity of parameters in different clusters on different days of the culture. Clusters with only one parameter has been removed from the figures as their similarity with themselves is always unity. Panel on the right hand side provides the similarity measures. (Abbreviations for figures 16 to 30 : ACC – Average Cell Compactness, ACD – Average Cell Density, ACV – Average Cell Volume, EGN – Elapsed Generation Number, ECT – Elapsed Culture Time)

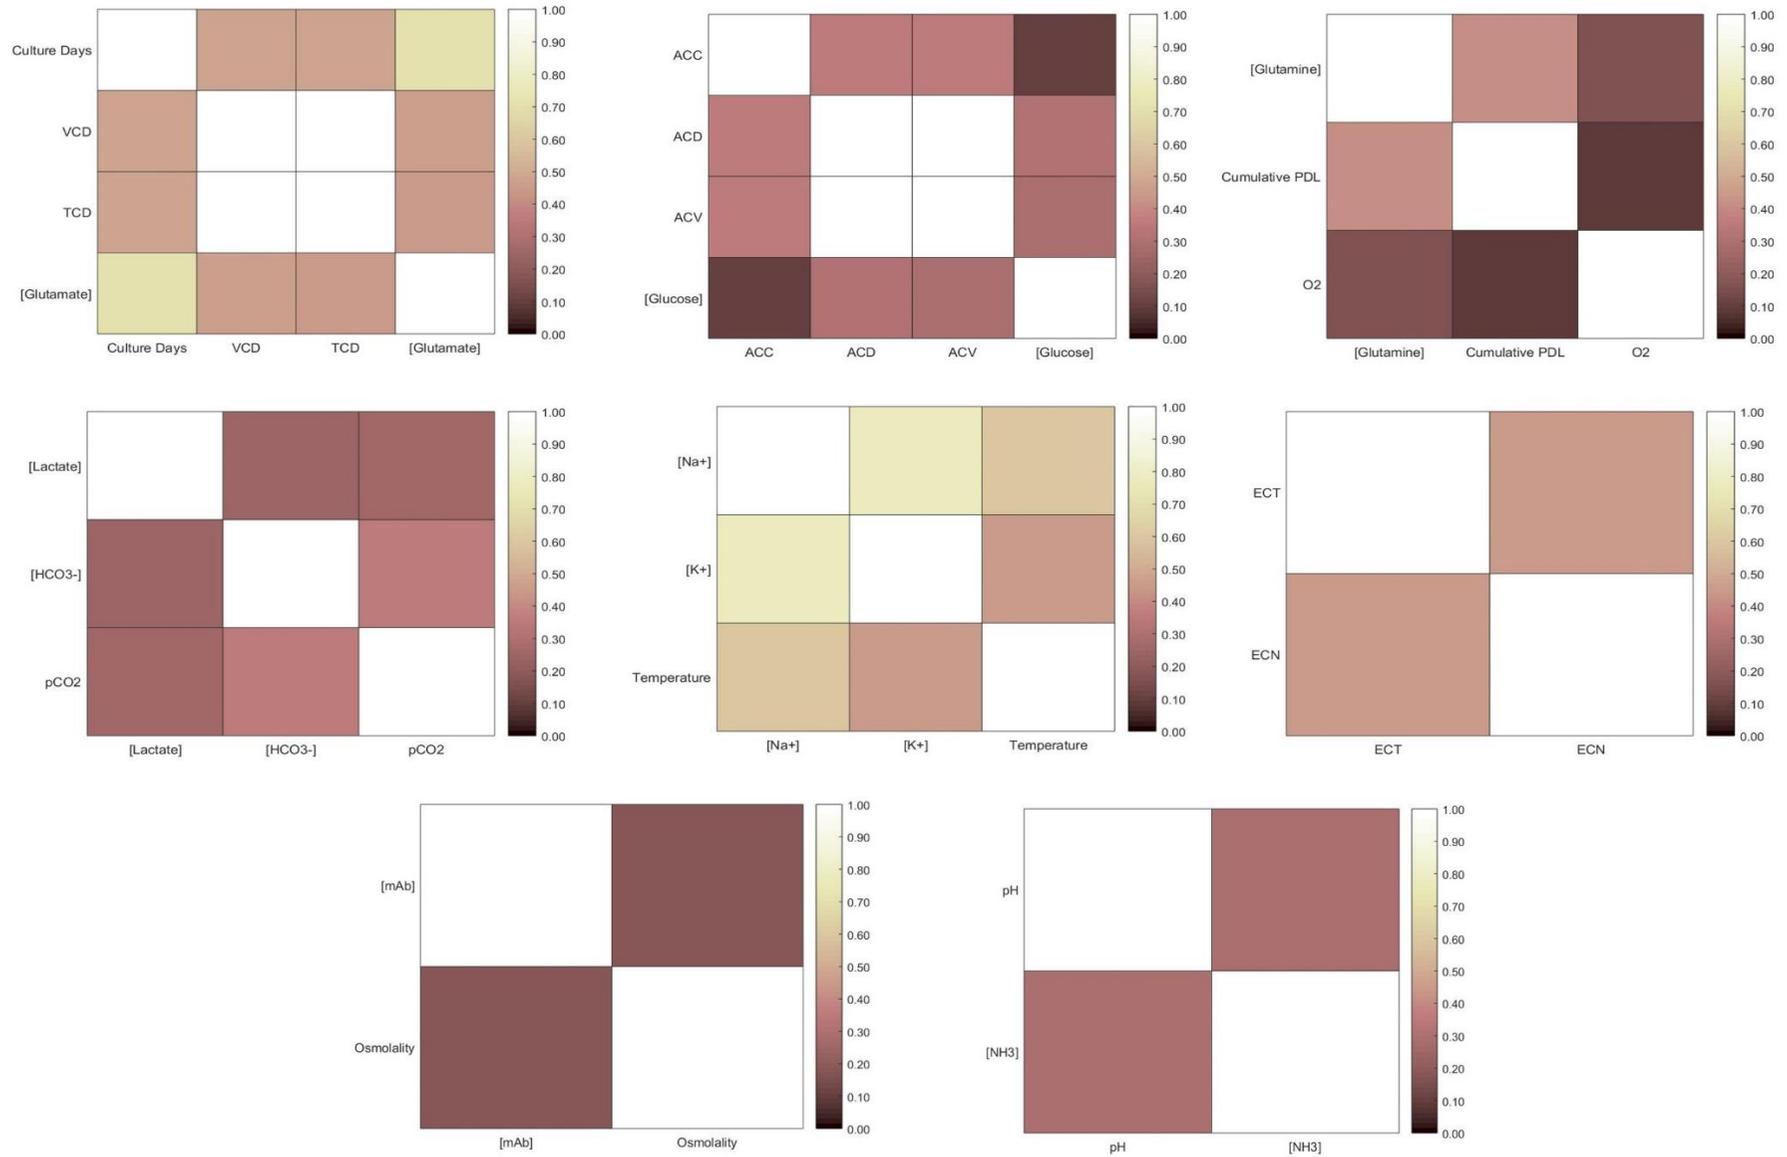

Figure 16: Similarity heat maps of parameters in the same cluster for Day 1 of the culture. Refer to the explanation above to interpret results.

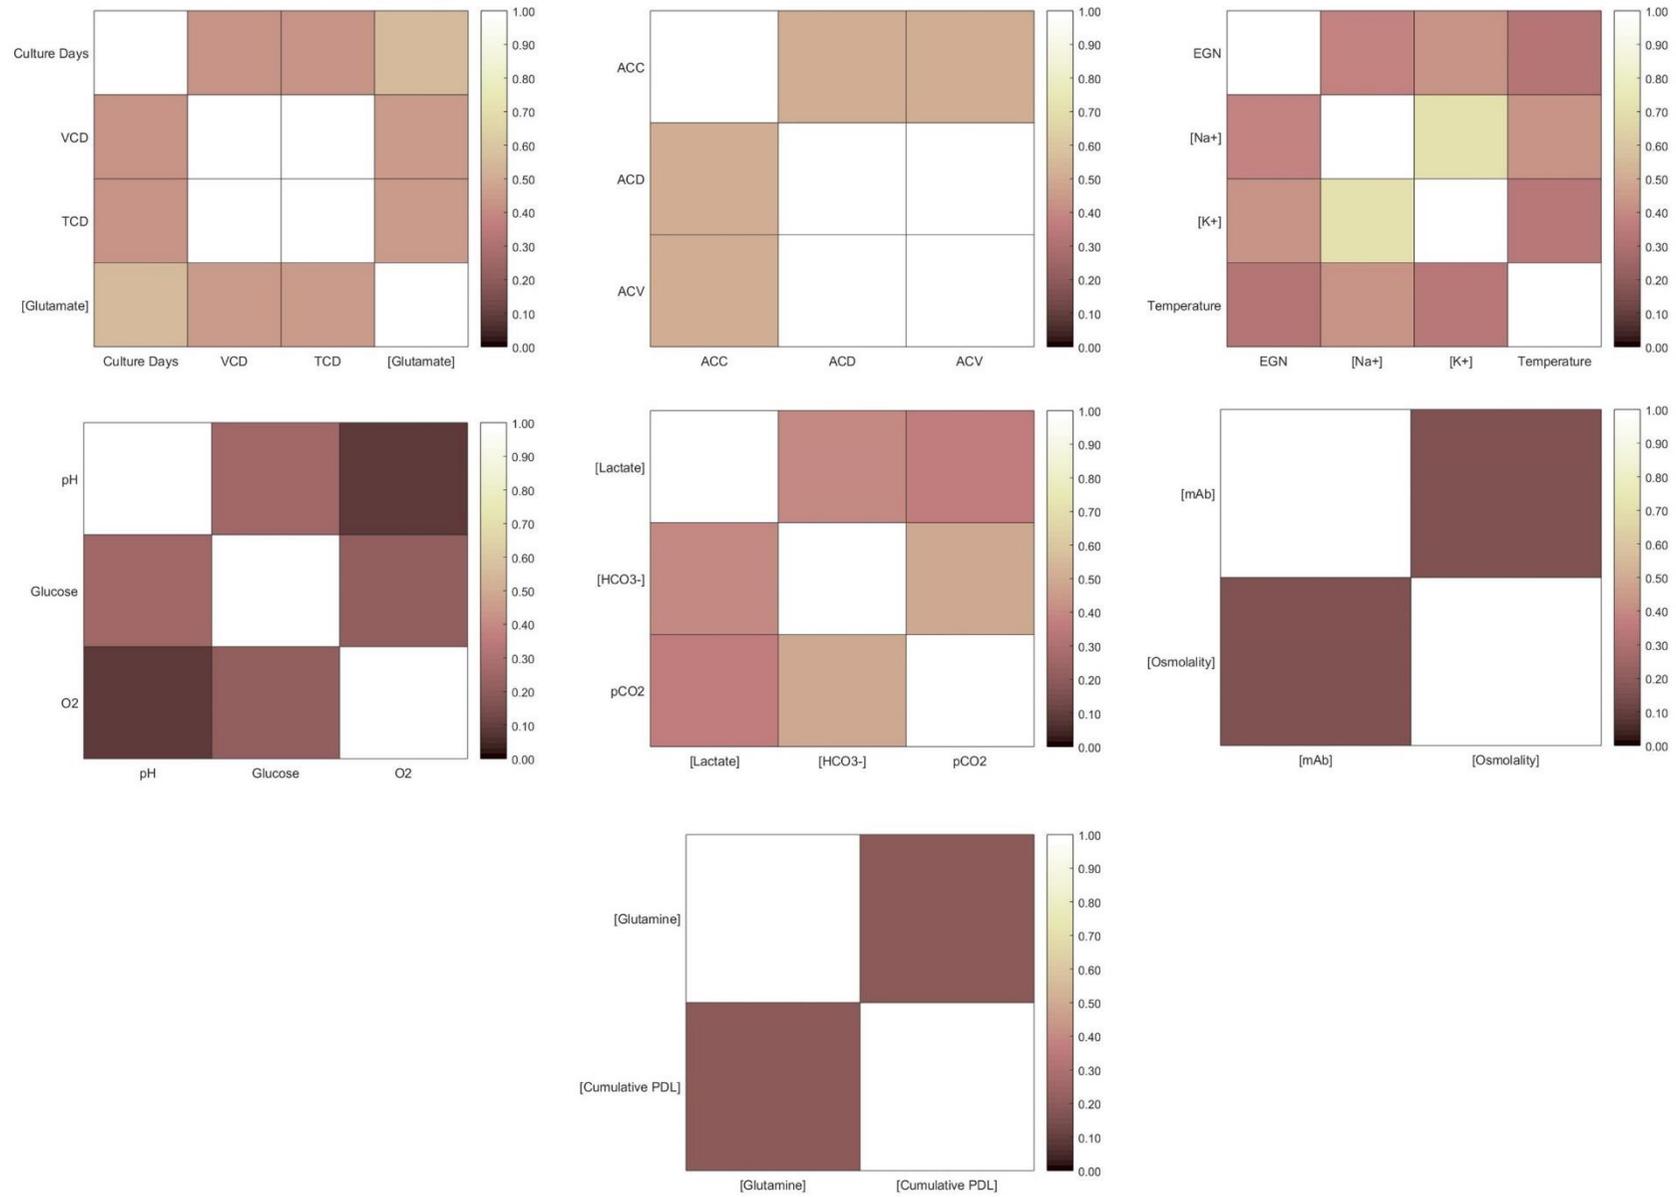

Figure 17: Similarity heat maps of parameters in the same cluster for Day 2 of the culture. Refer to the explanation above to interpret results.

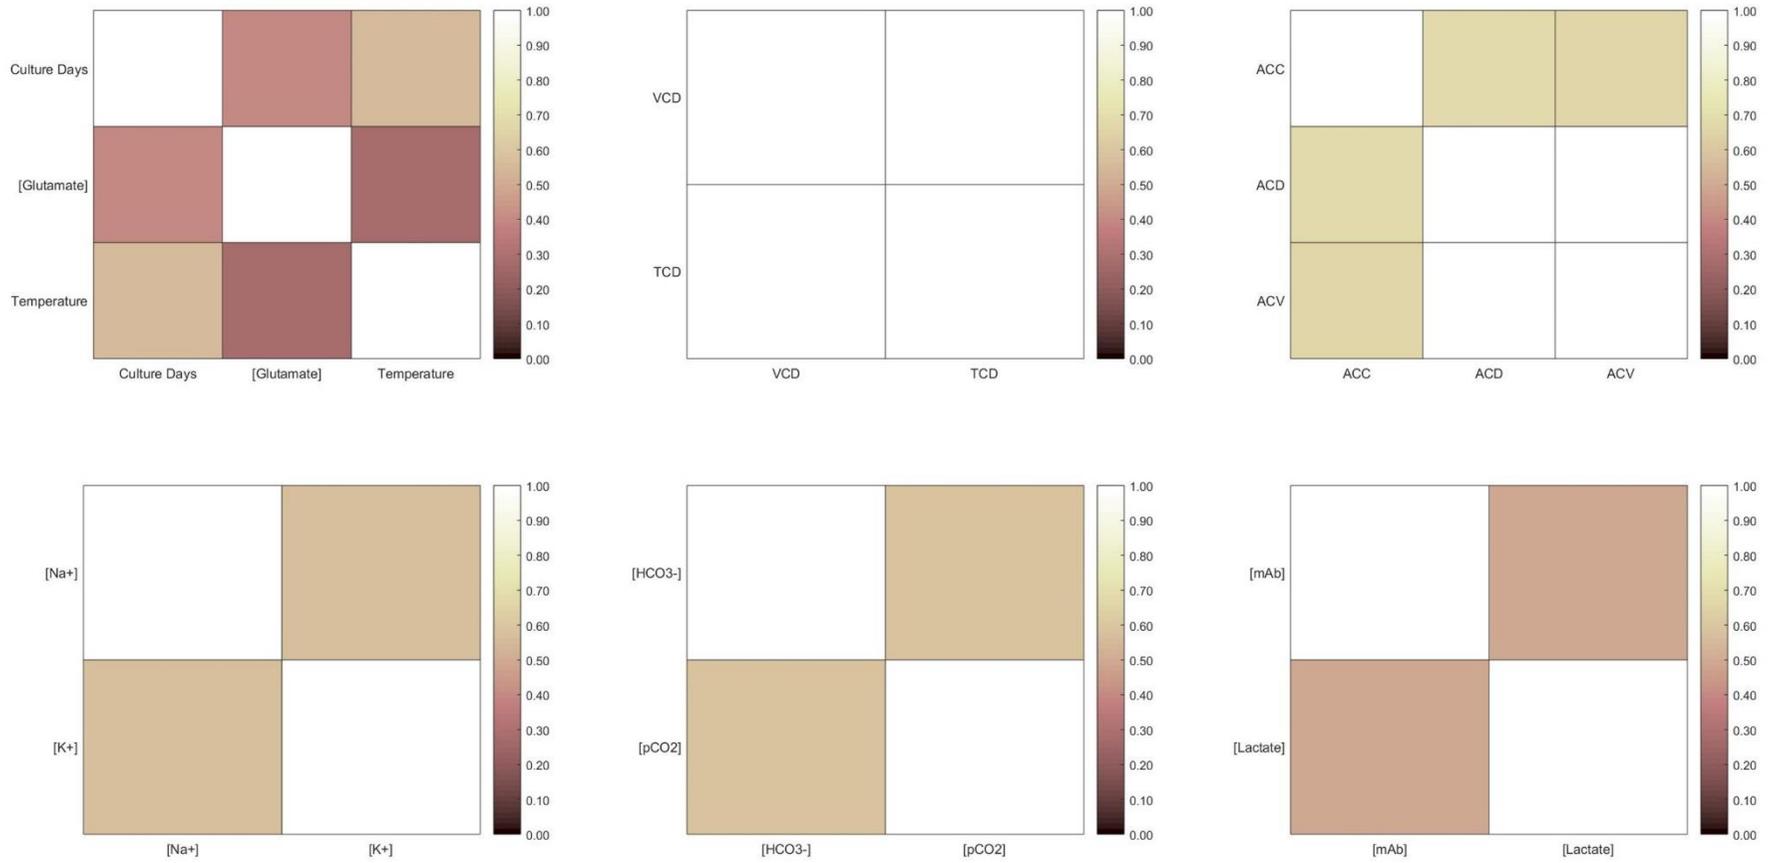

Figure 18: Similarity heat maps of parameters in the same cluster for Day 3 of the culture. Refer to the explanation above to interpret results.

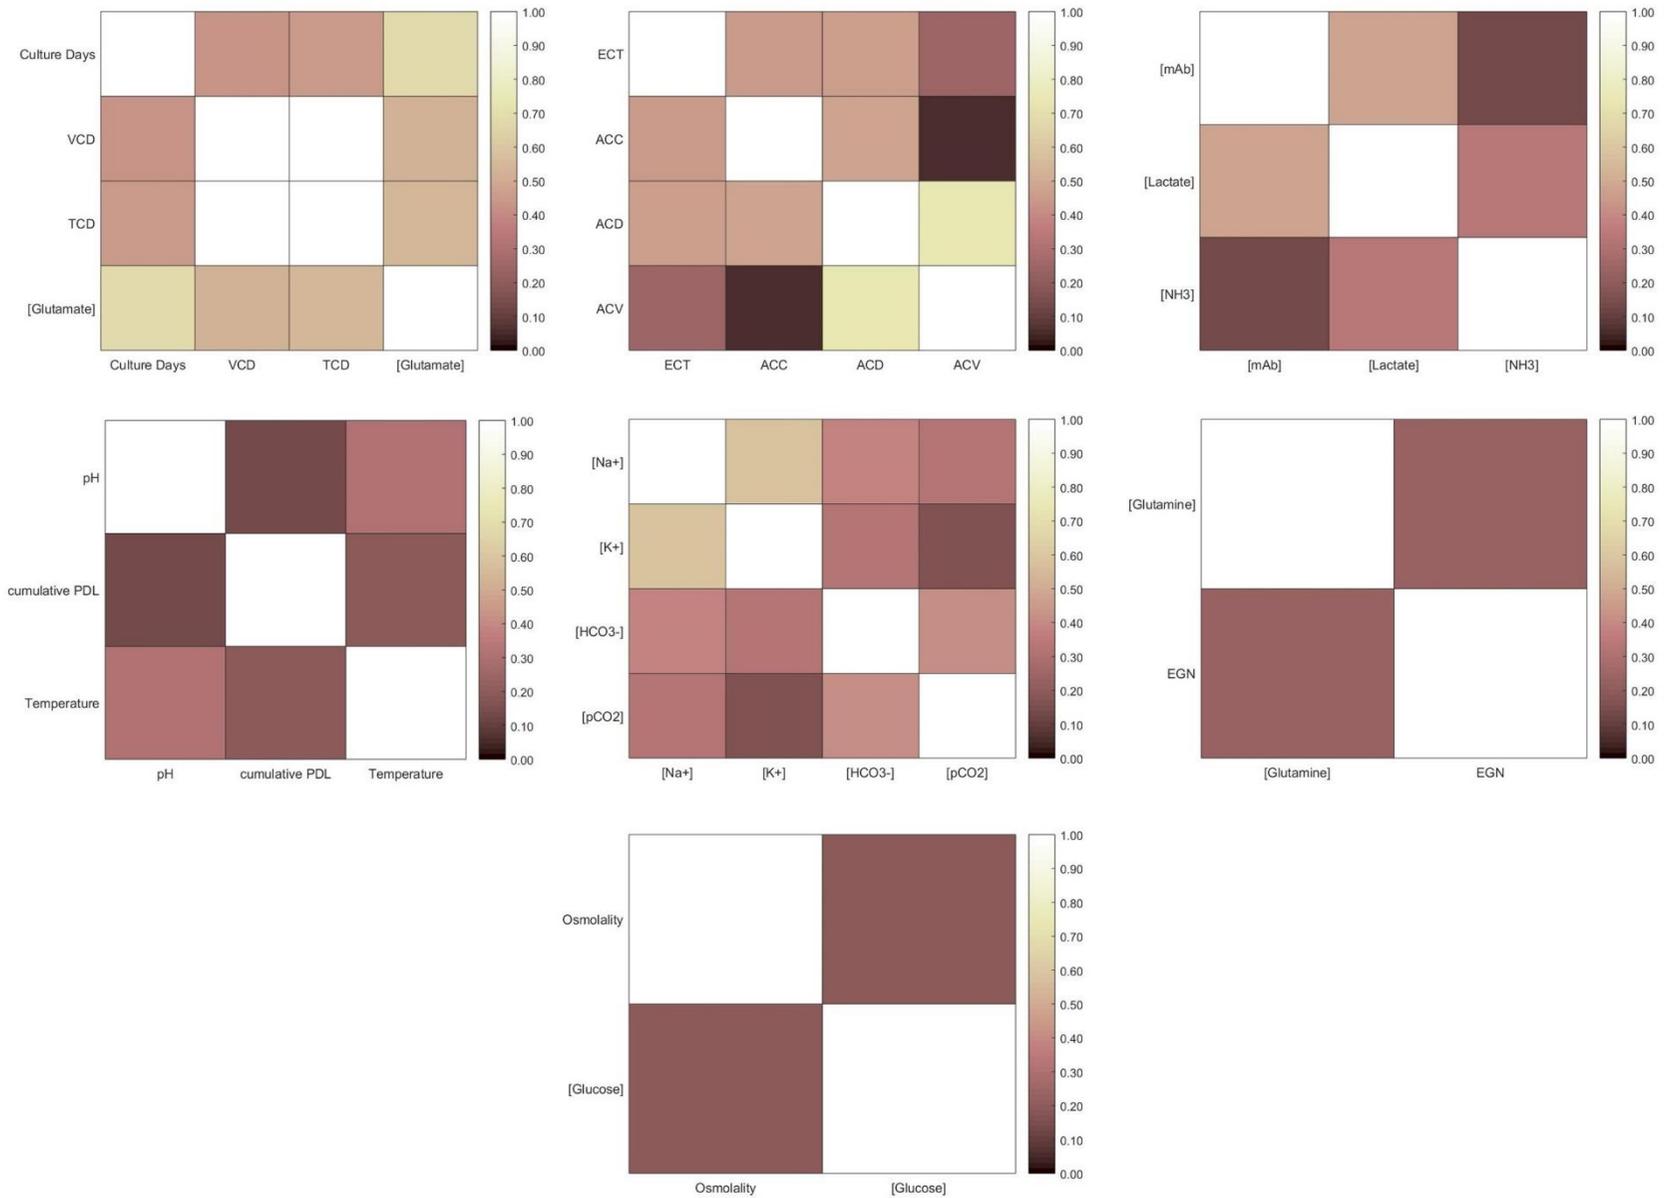

Figure 19: Similarity heat maps of parameters in the same cluster for Day 4 of the culture. Refer to the explanation above to interpret results.

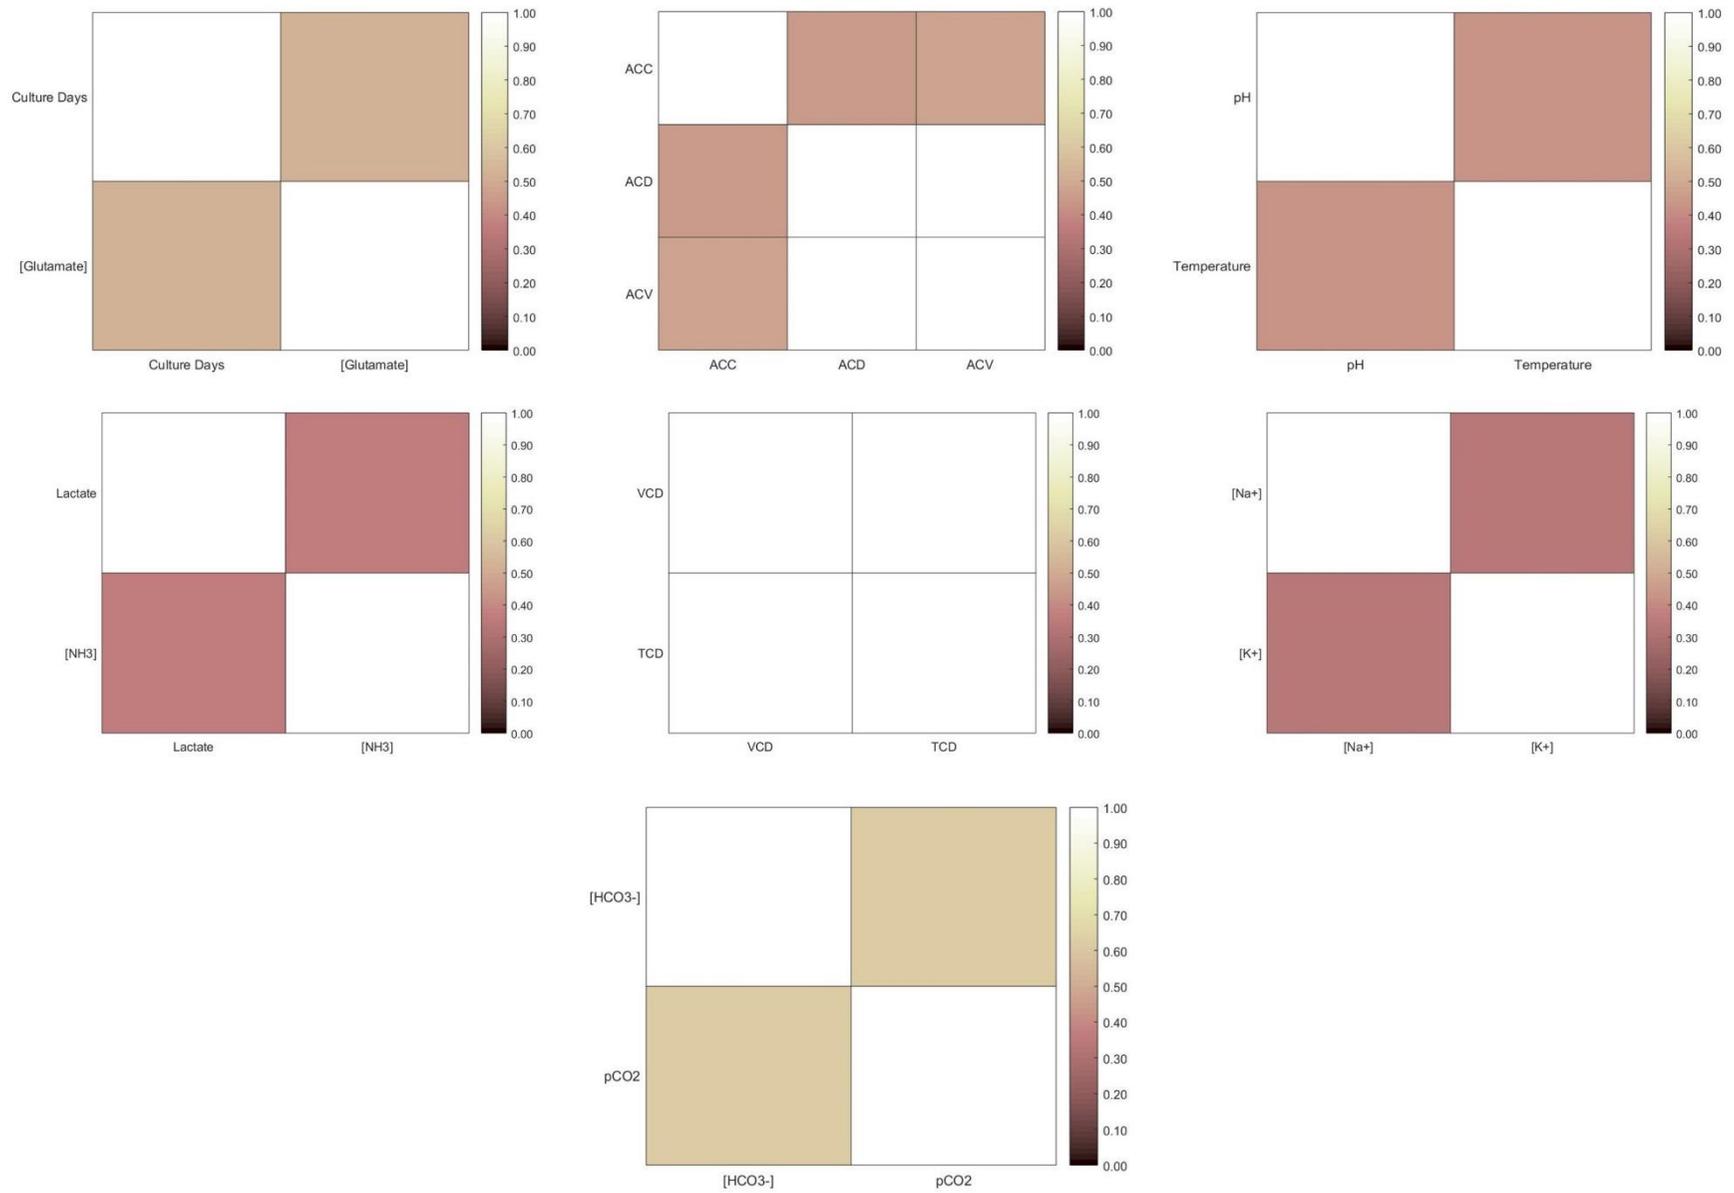

Figure 20: Similarity heat maps of parameters in the same cluster for Day 5 of the culture. Refer to the explanation above to interpret results.

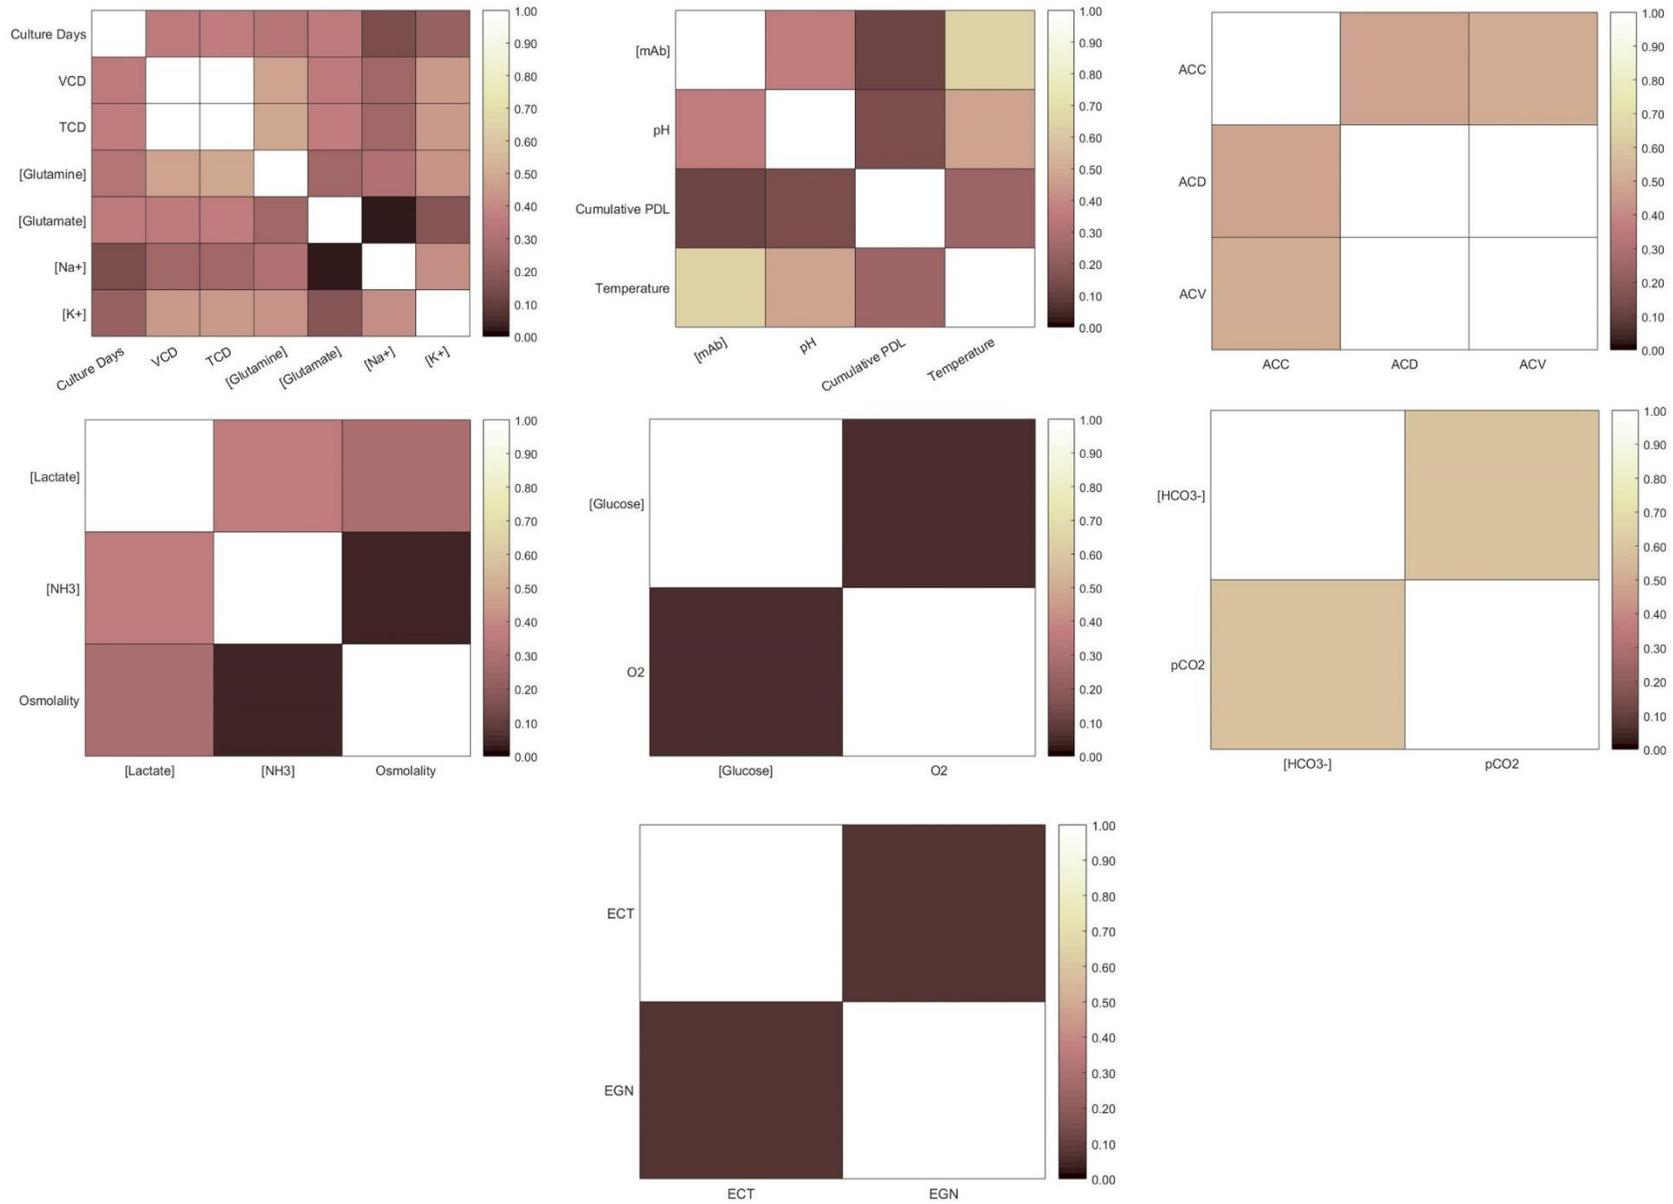

Figure 21: Similarity heat maps of parameters in the same cluster for Day 6 of the culture. Refer to the explanation above to interpret results.

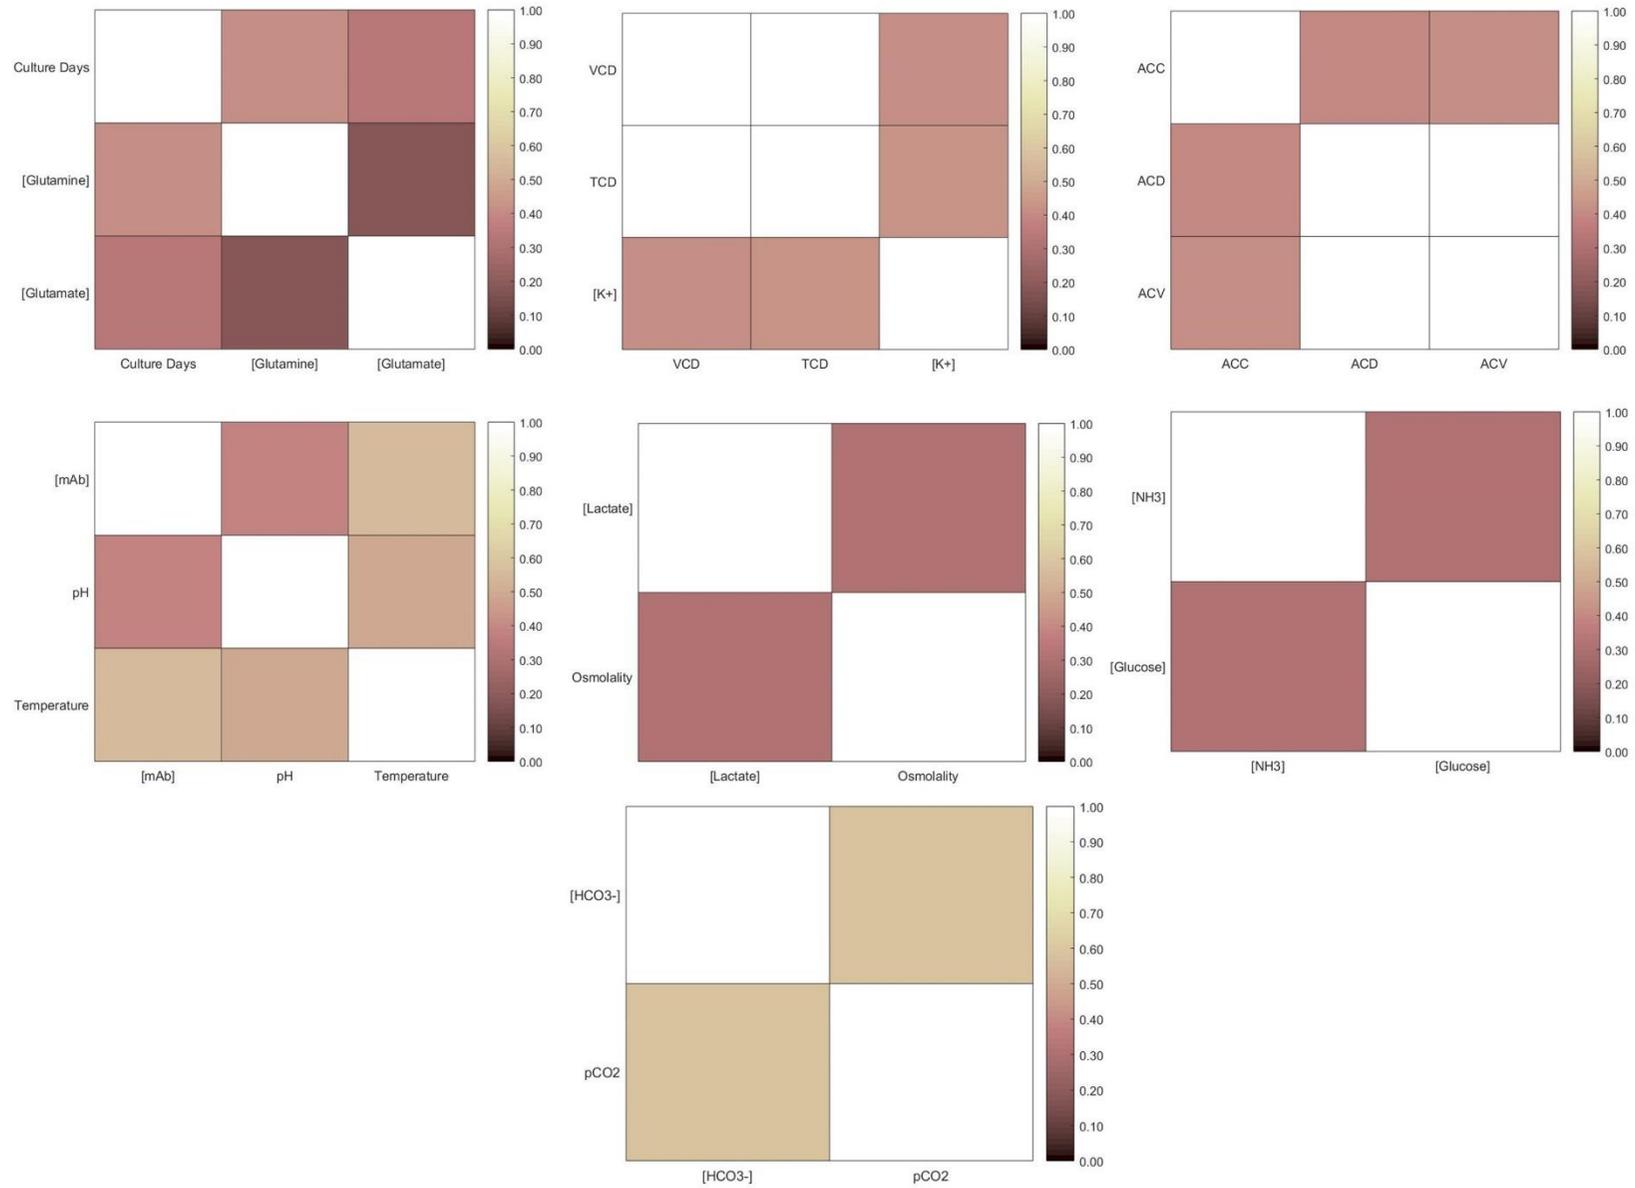

Figure 22: Similarity heat maps of parameters in the same cluster for Day 7 of the culture. Refer to the explanation above to interpret results.

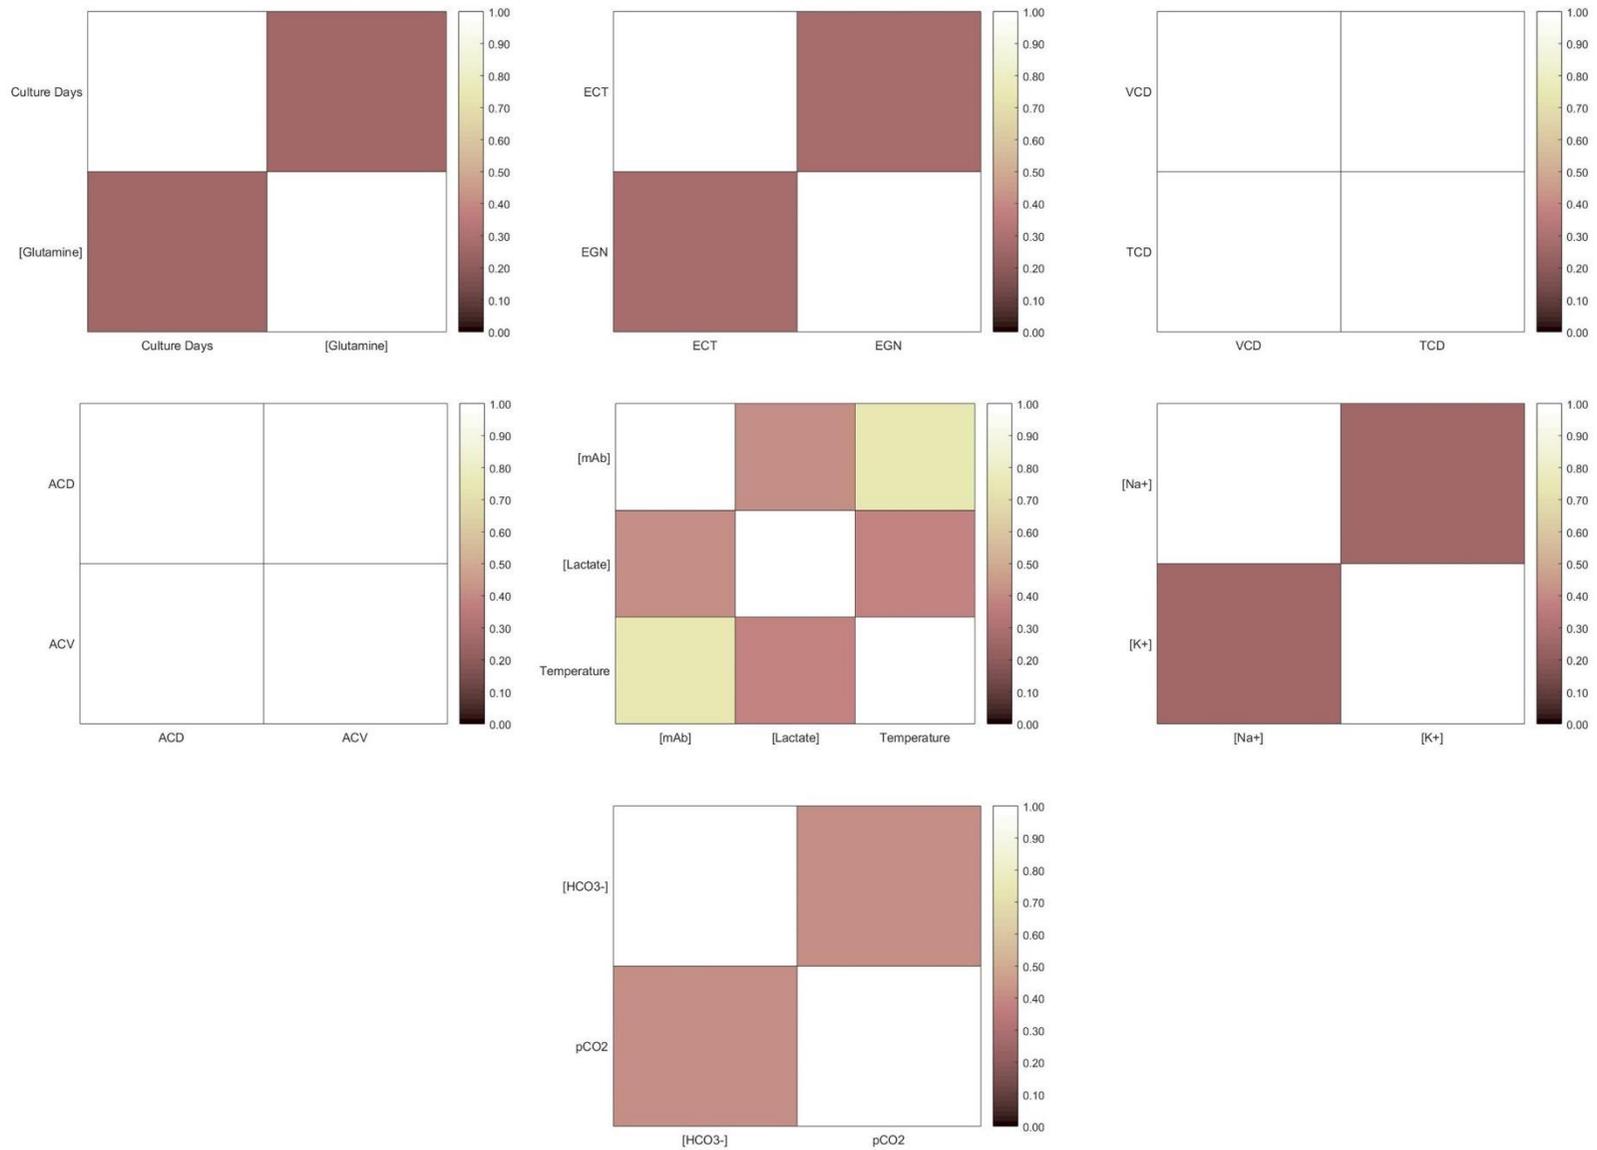

Figure 23: Similarity heat maps of parameters in the same cluster for Day 8 of the culture. Refer to the explanation above to interpret results.

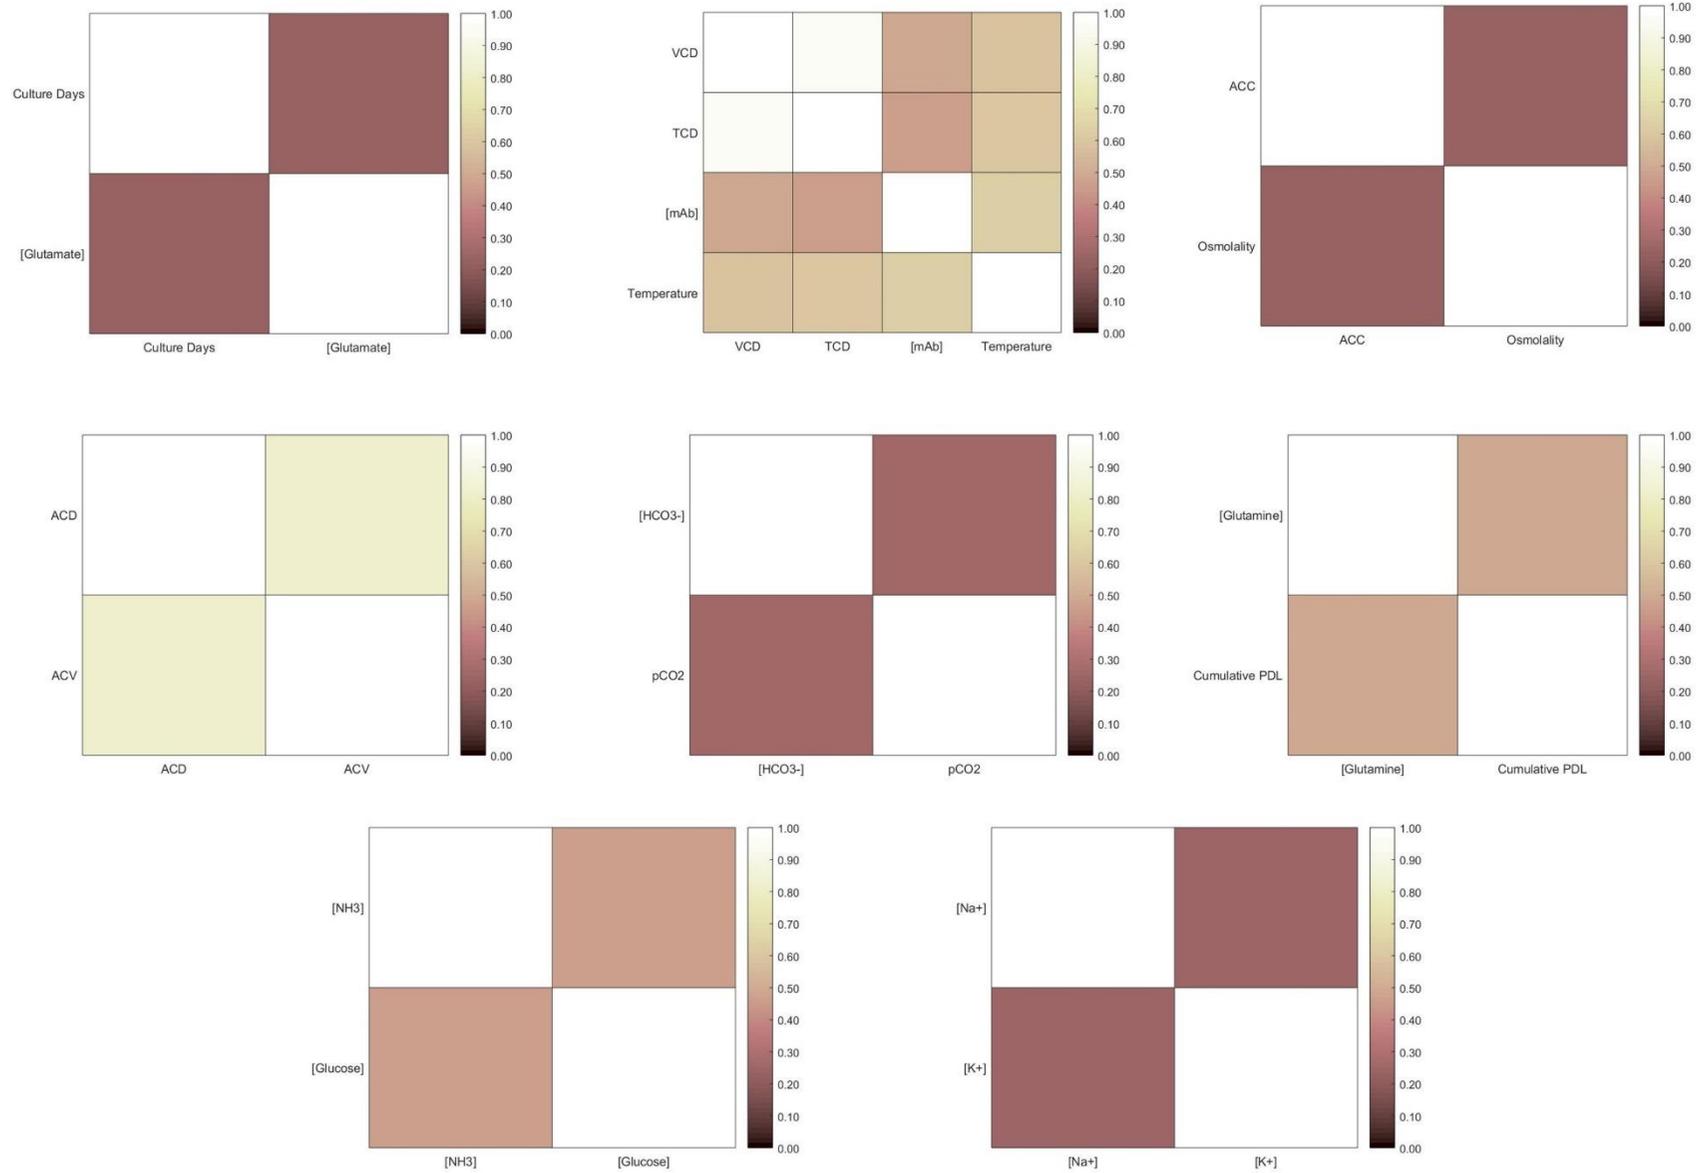

Figure 24: Similarity heat maps of parameters in the same cluster for Day 9 of the culture. Refer to the explanation above to interpret results.

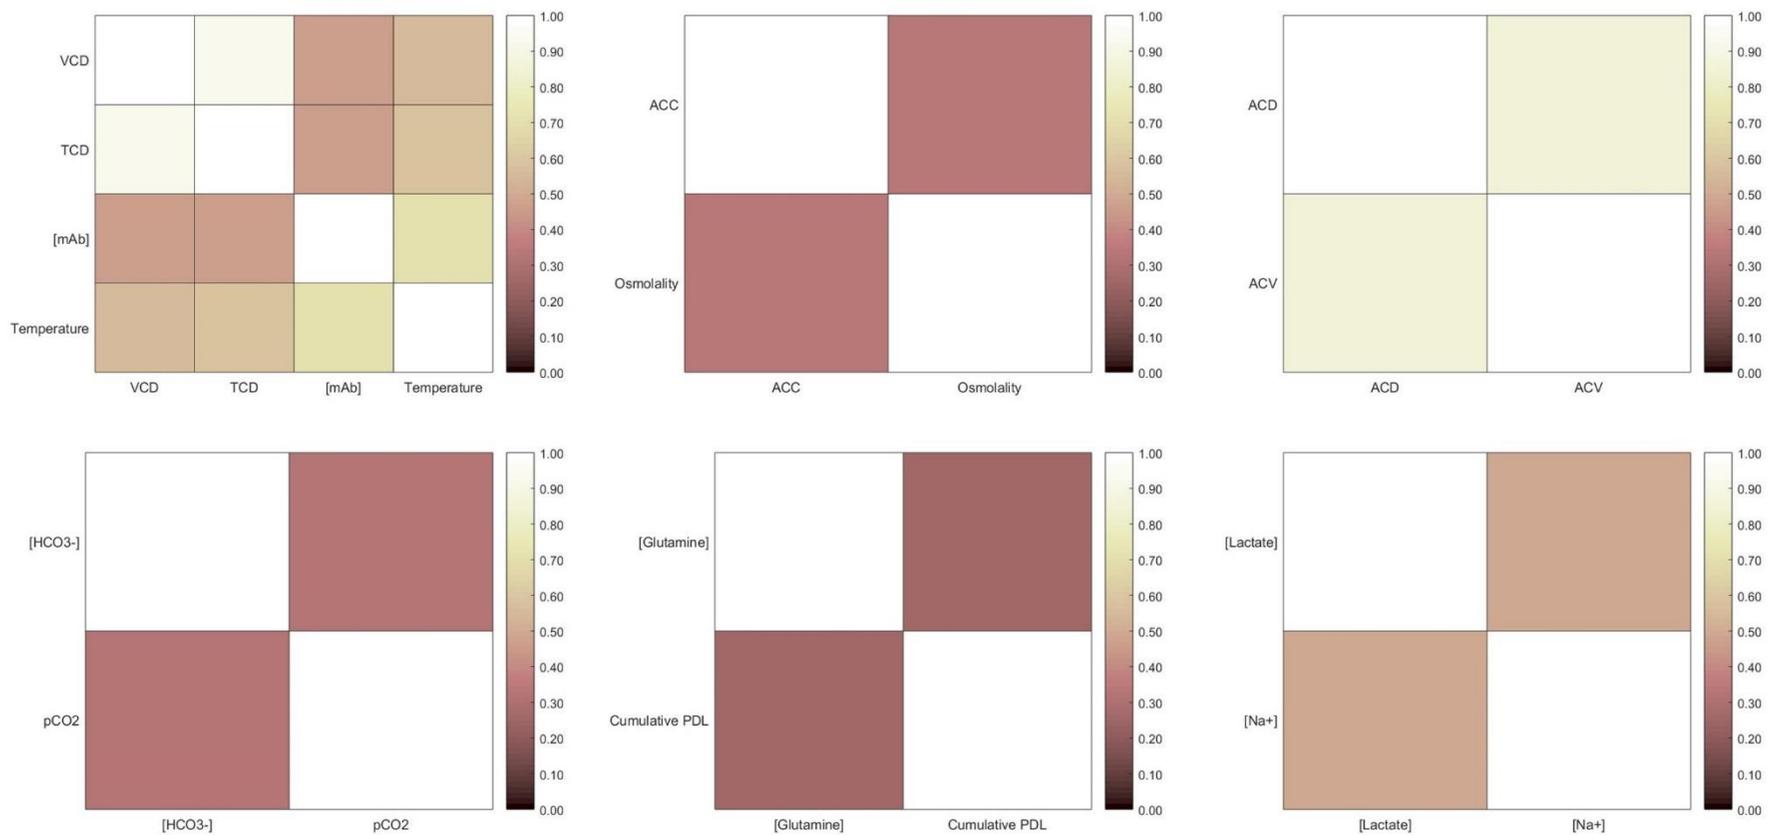

Figure 25: Similarity heat maps of parameters in the same cluster for Day 10 of the culture. Refer to the explanation above to interpret results.

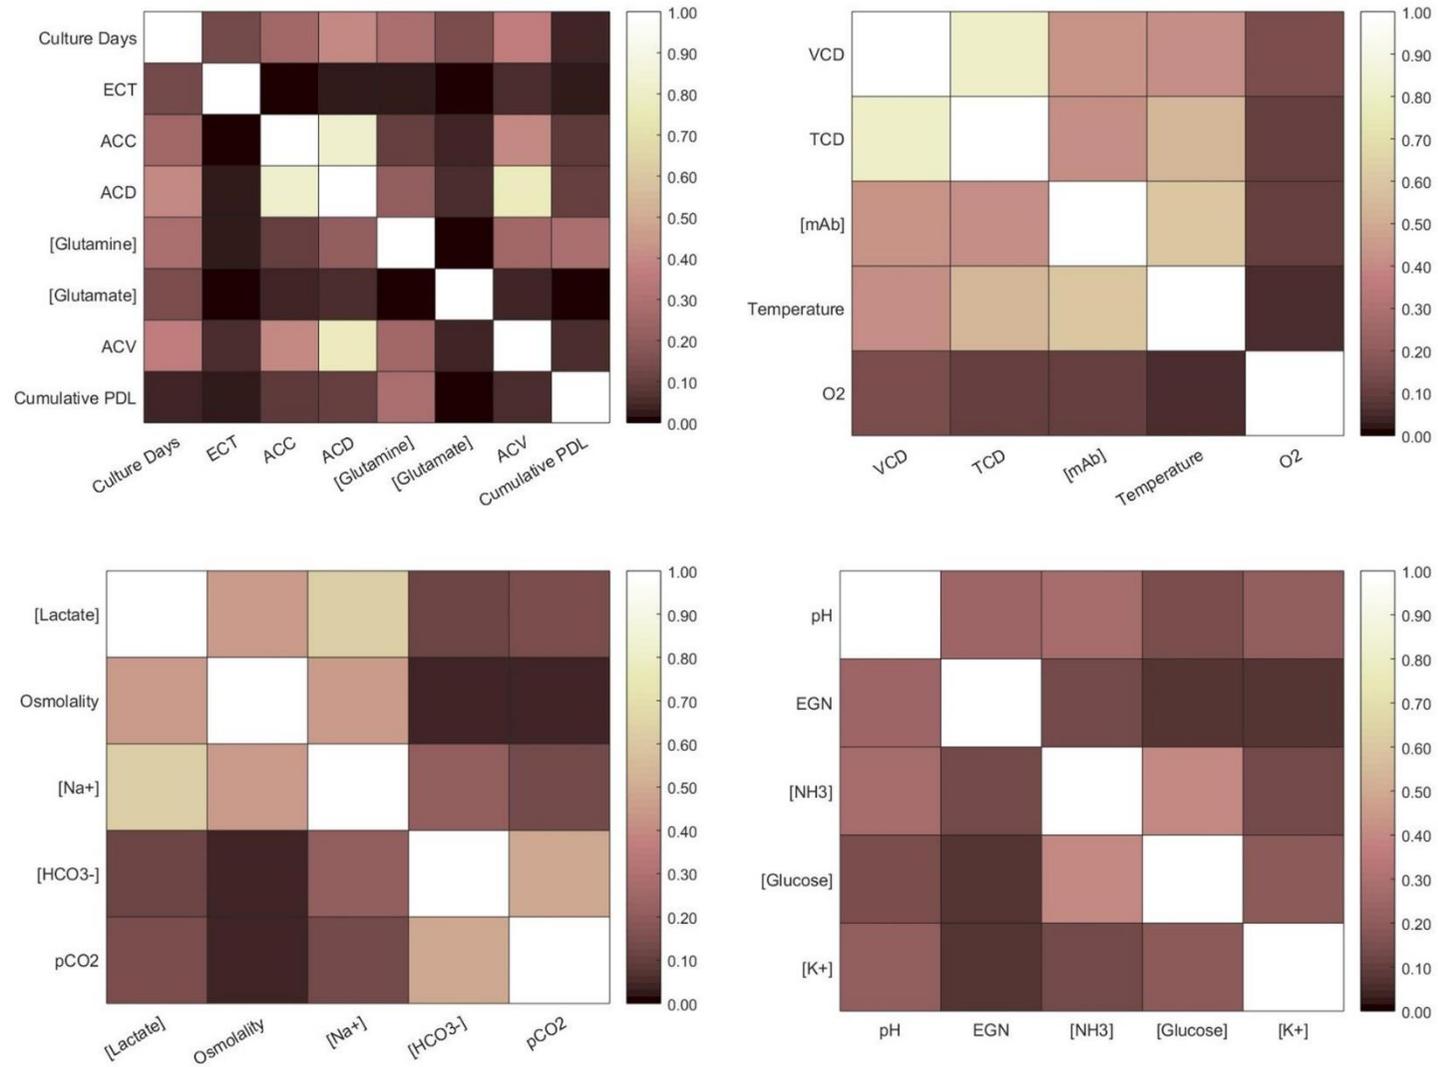

Figure 26: Similarity heat maps of parameters in the same cluster for Day 11 of the culture. Refer to the explanation above to interpret results.

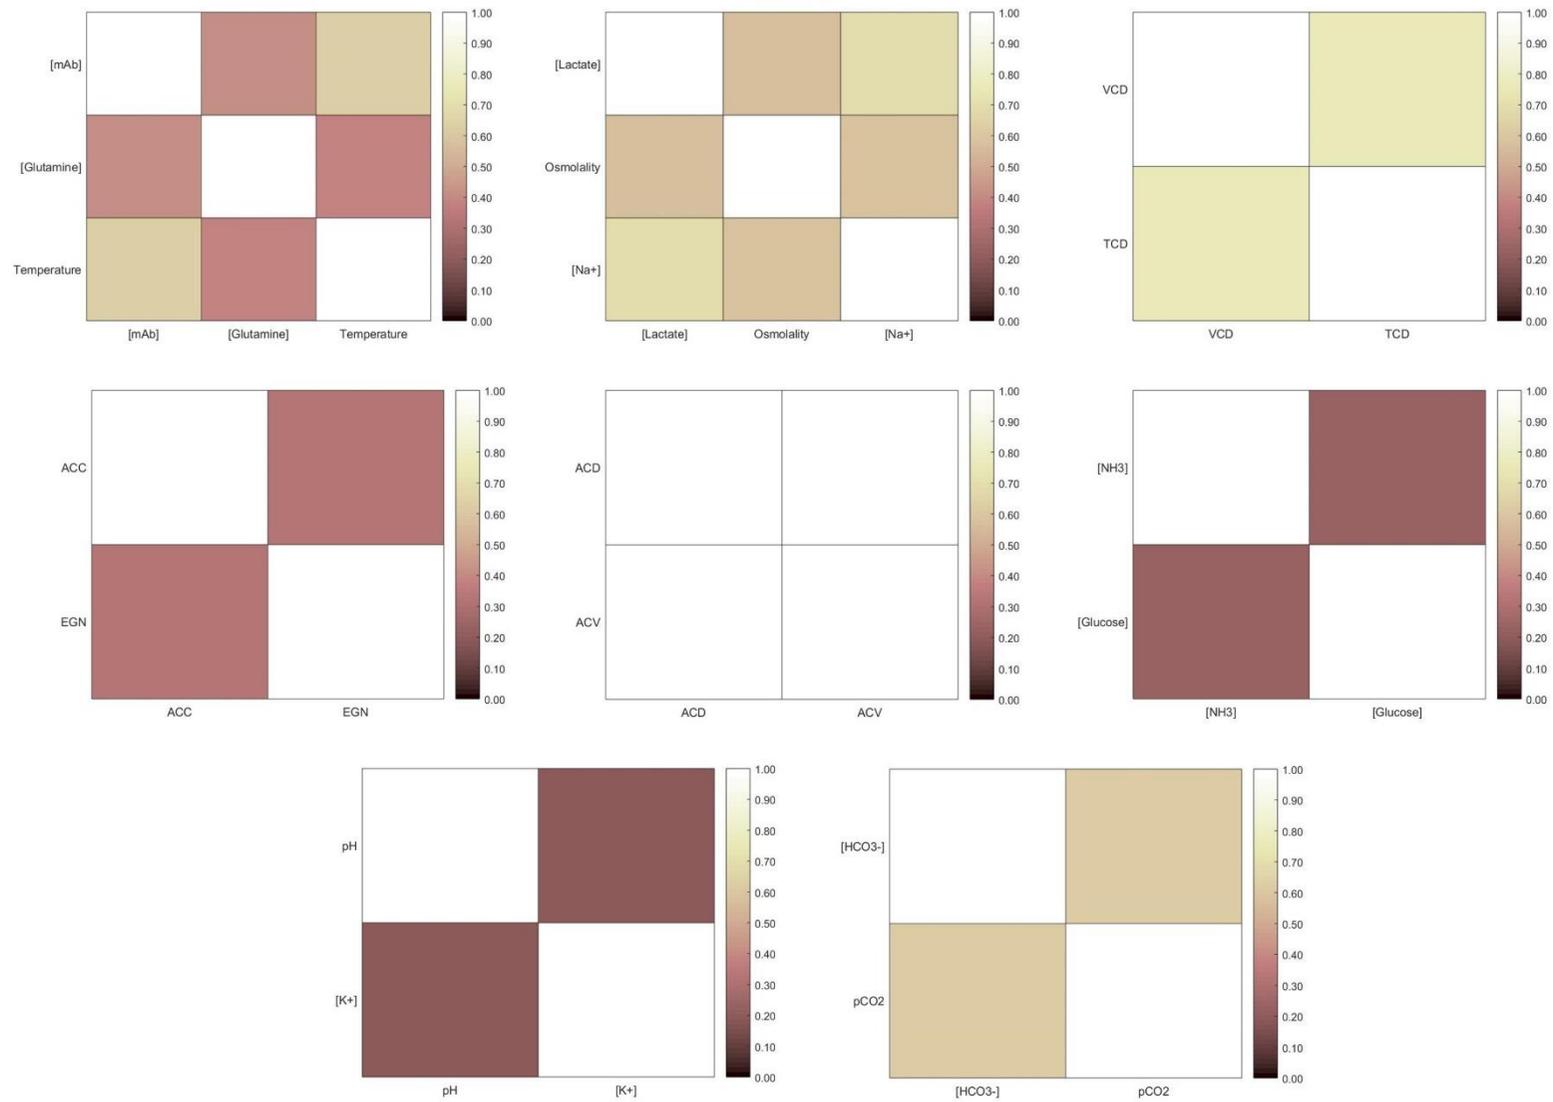

Figure 27: Similarity heat maps of parameters in the same cluster for Day 12 of the culture. Refer to the explanation above to interpret results.

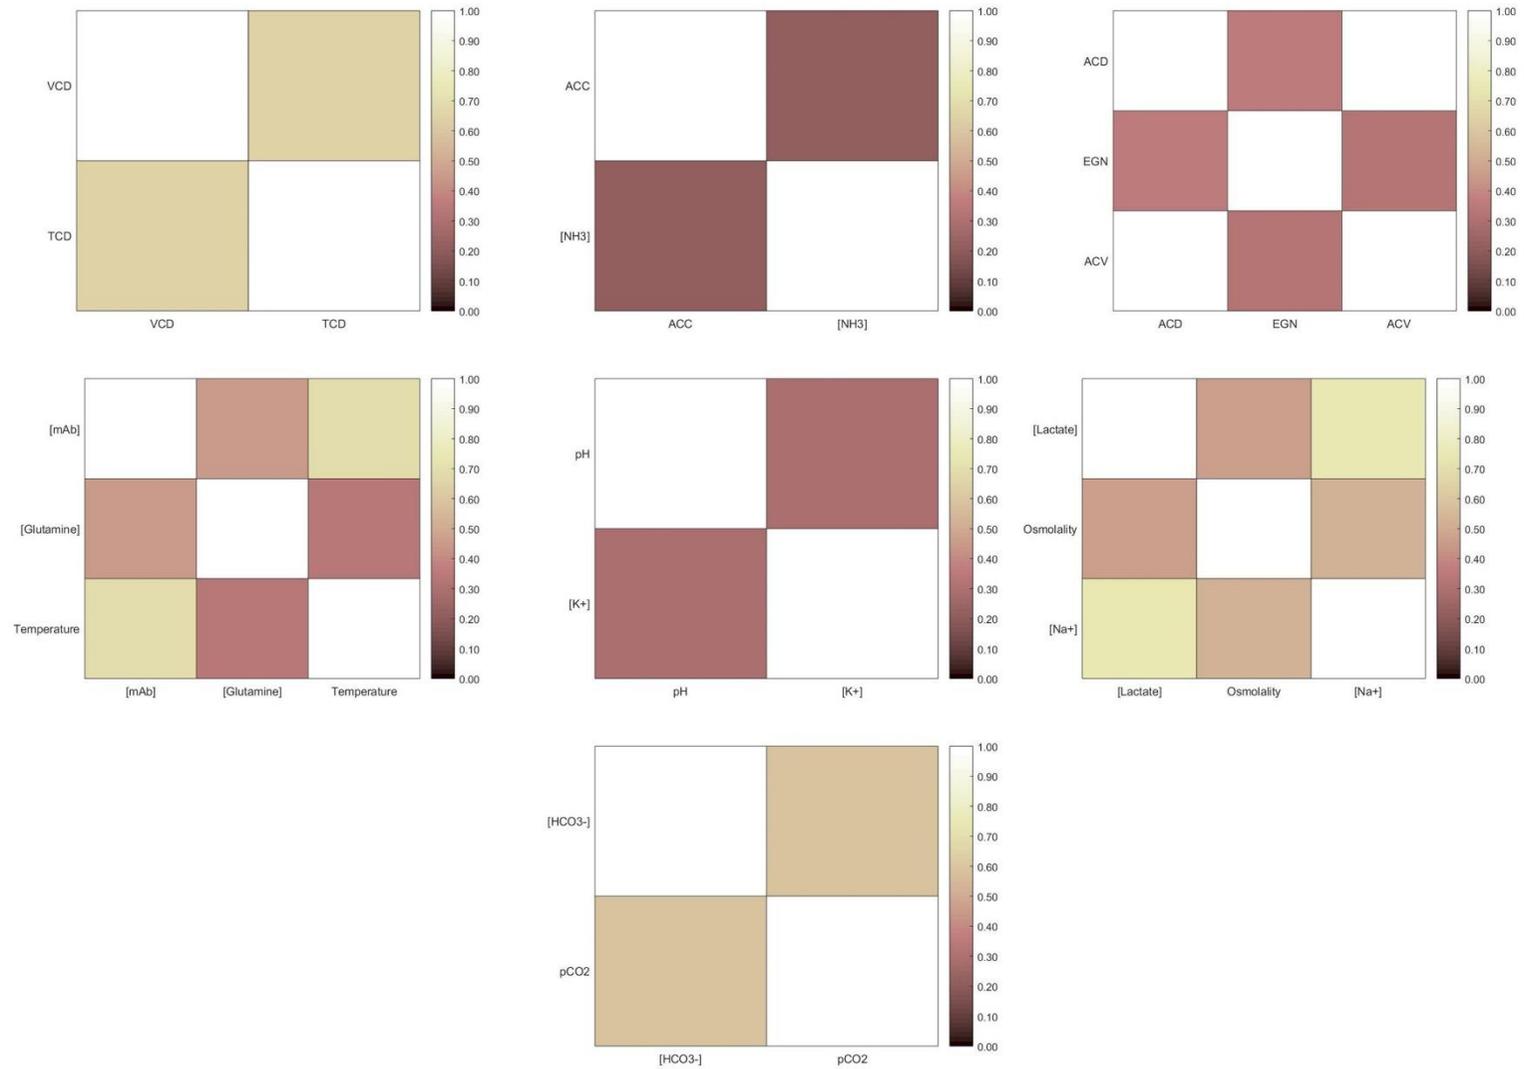

Figure 28: Similarity heat maps of parameters in the same cluster for Day 13 of the culture. Refer to the explanation above to interpret results.

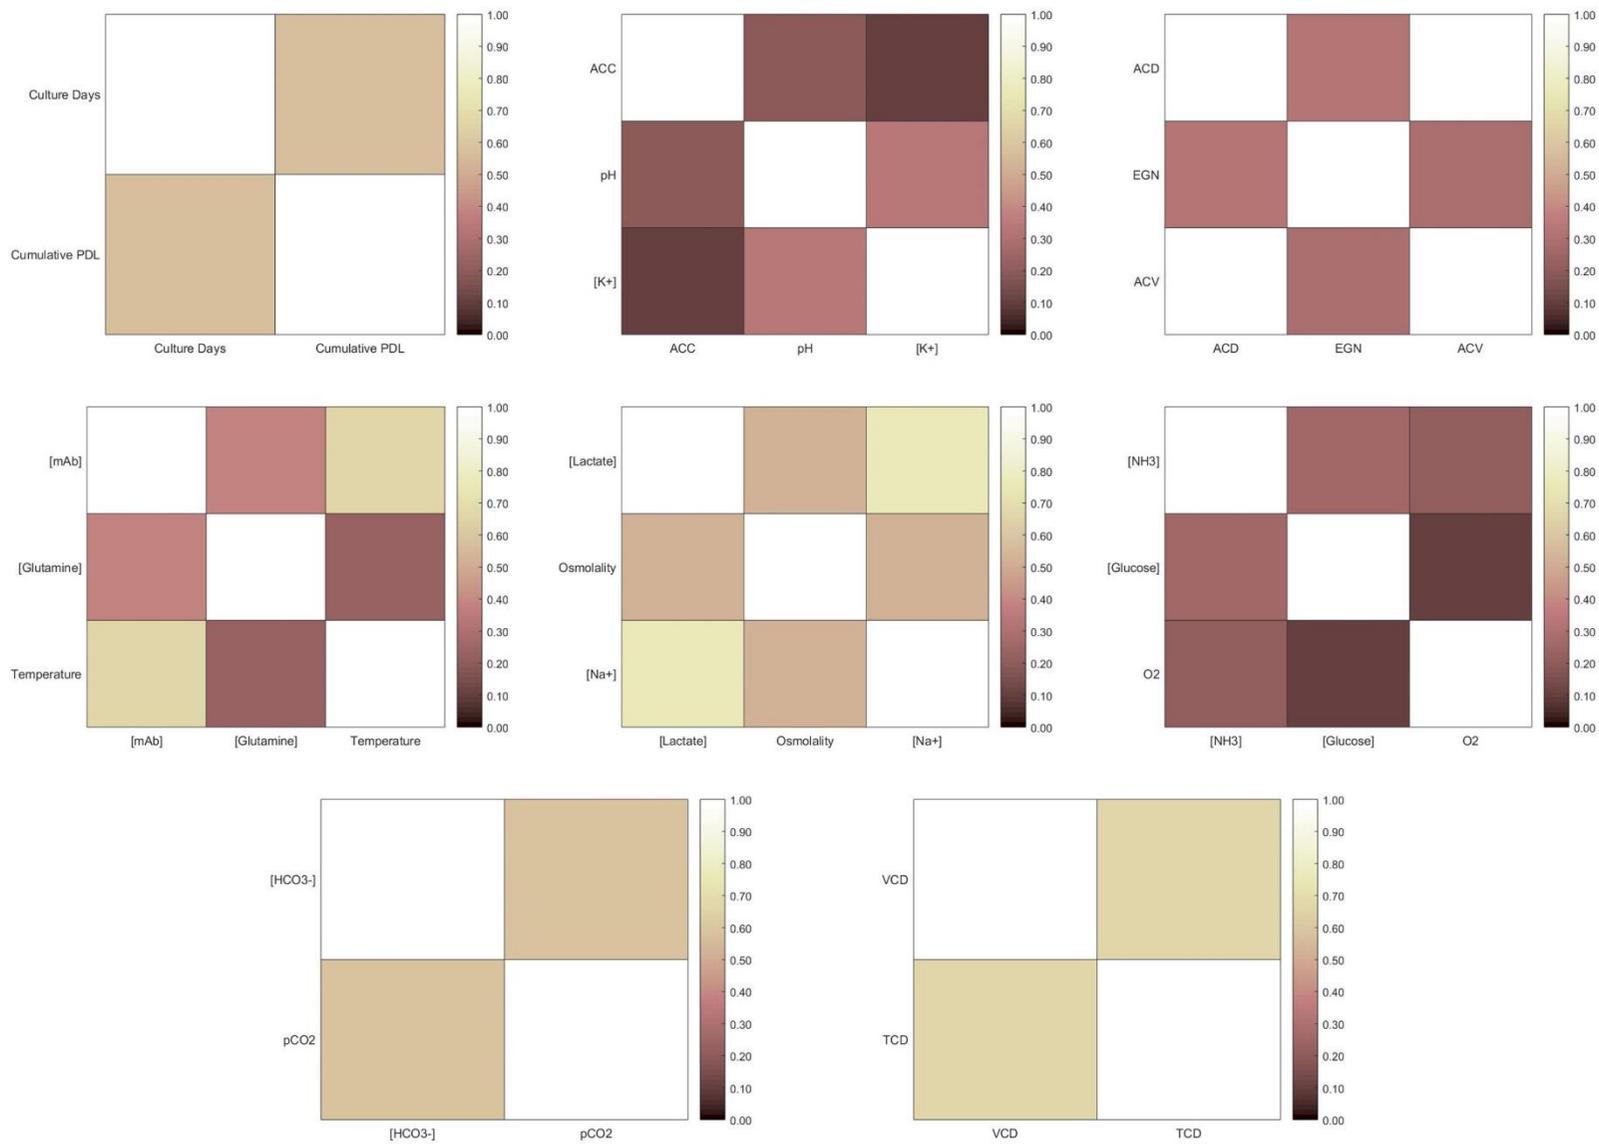

Figure 29: Similarity heat maps of parameters in the same cluster for Day 14 of the culture. Refer to the explanation above to interpret results.

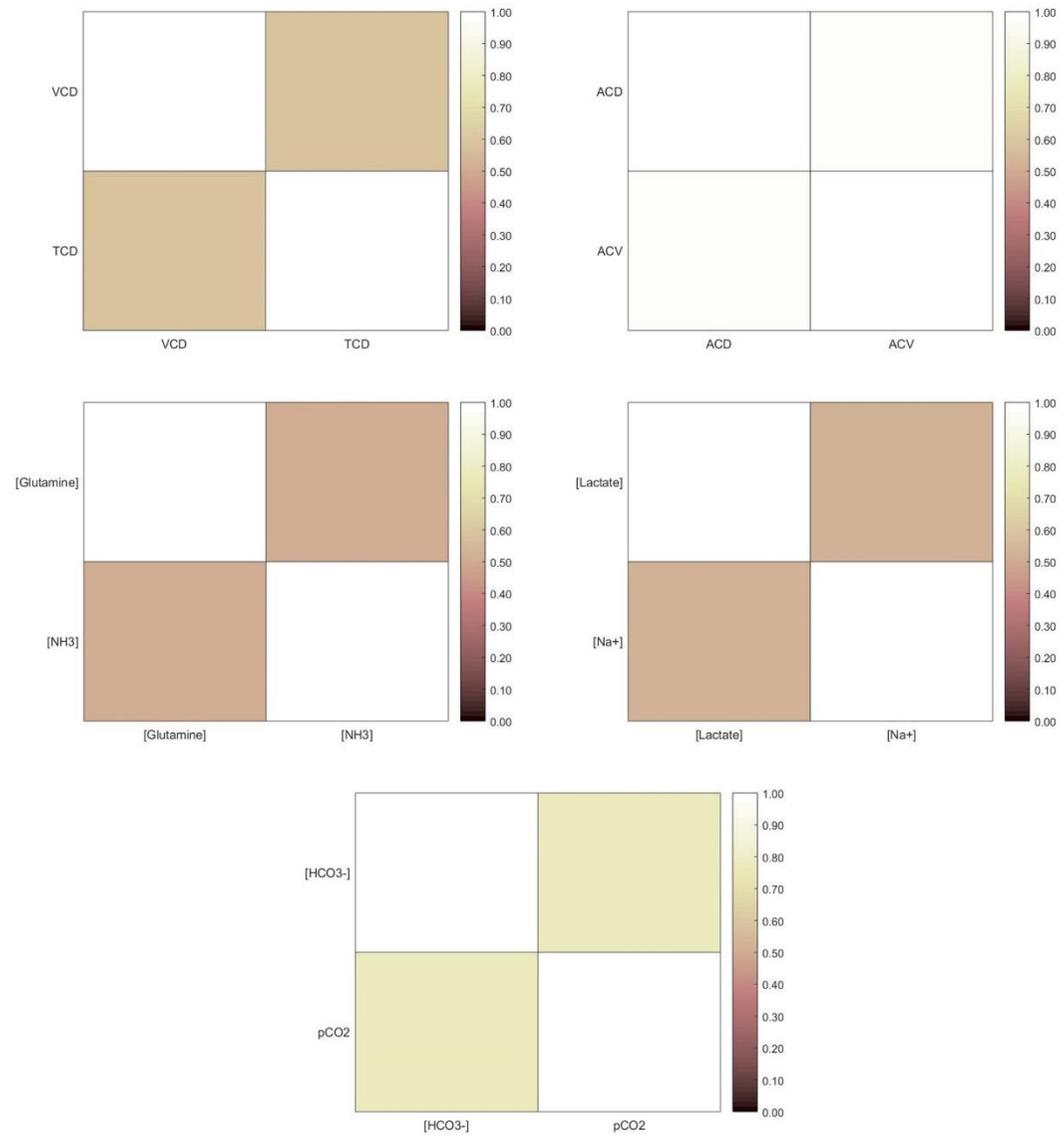

Figure 30: Similarity heat maps of parameters in the same cluster for Day 15 of the culture. Refer to the explanation above to interpret results.

4. Tanglegrams showing comparison of dendrogram of each day of the culture with remaining days. Lines of the same colour depicts parameters clustered together on both the days being compared. Scale at the bottom shows the height at which the parameters cluster.

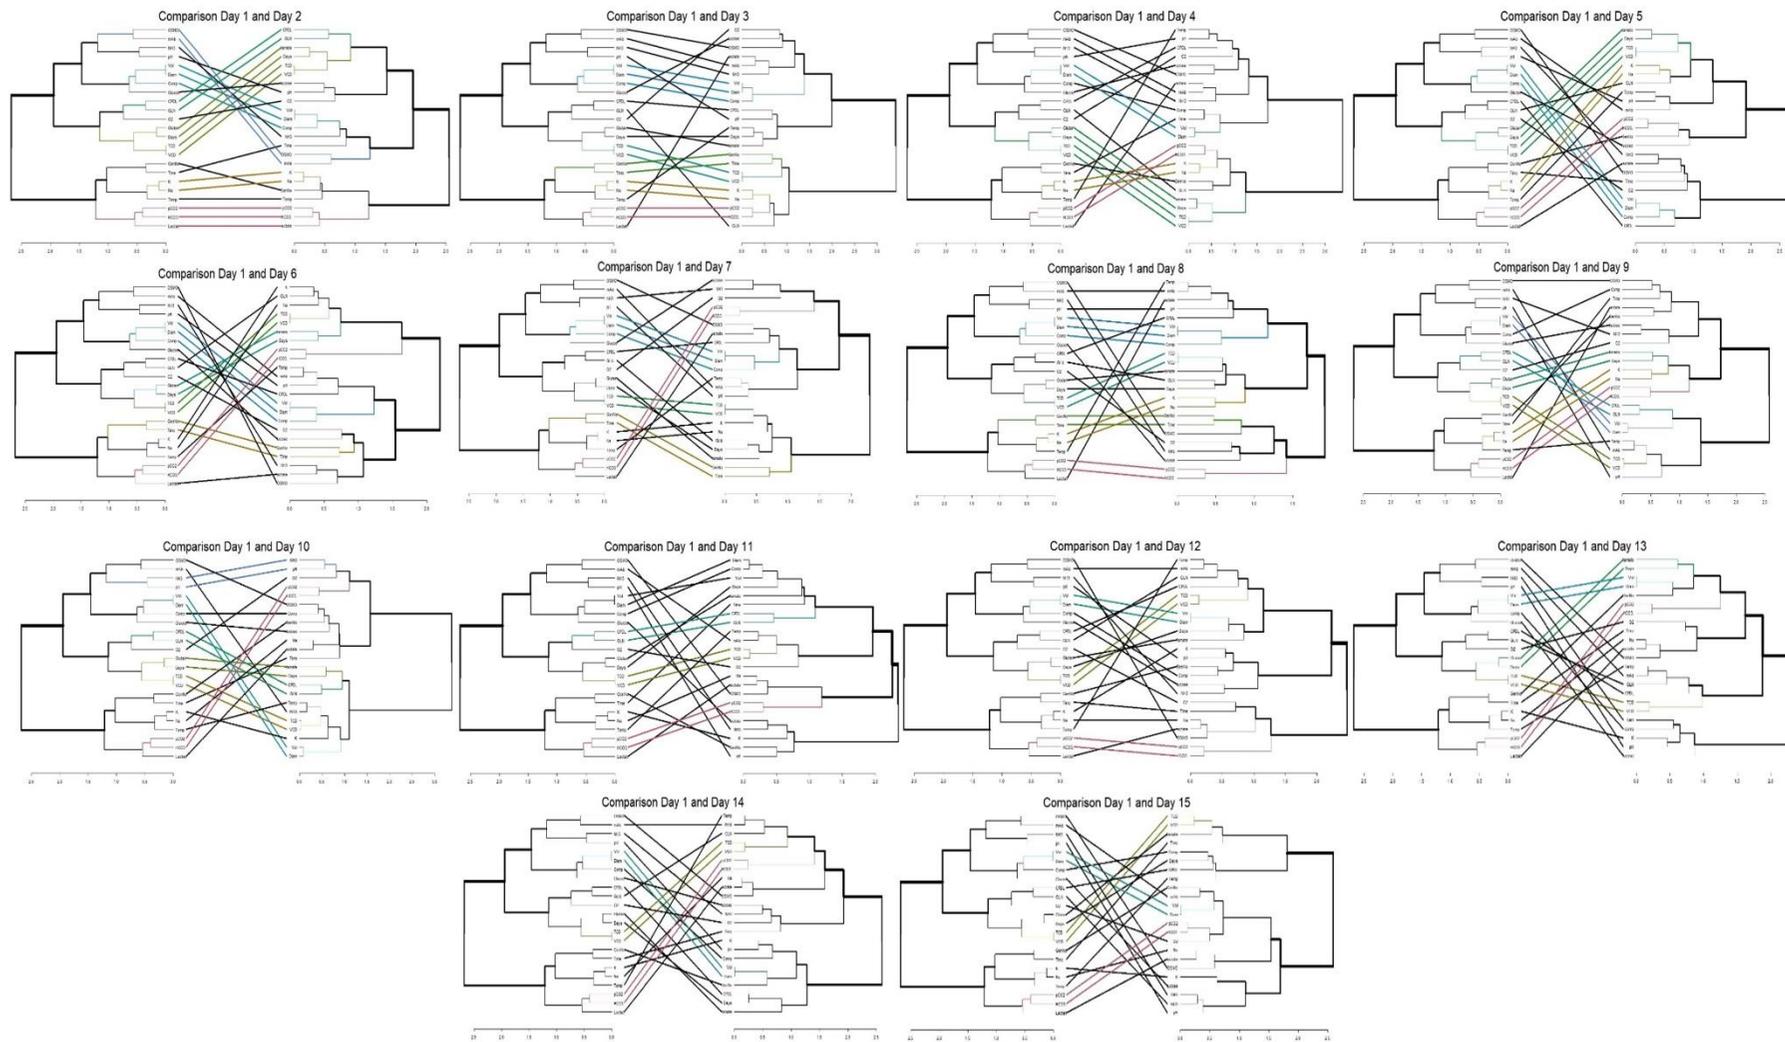

Figure 31: Tanglegrams for comparison of parameter clustering on Day 1 with the remaining days of culture. Refer to the explanation above.

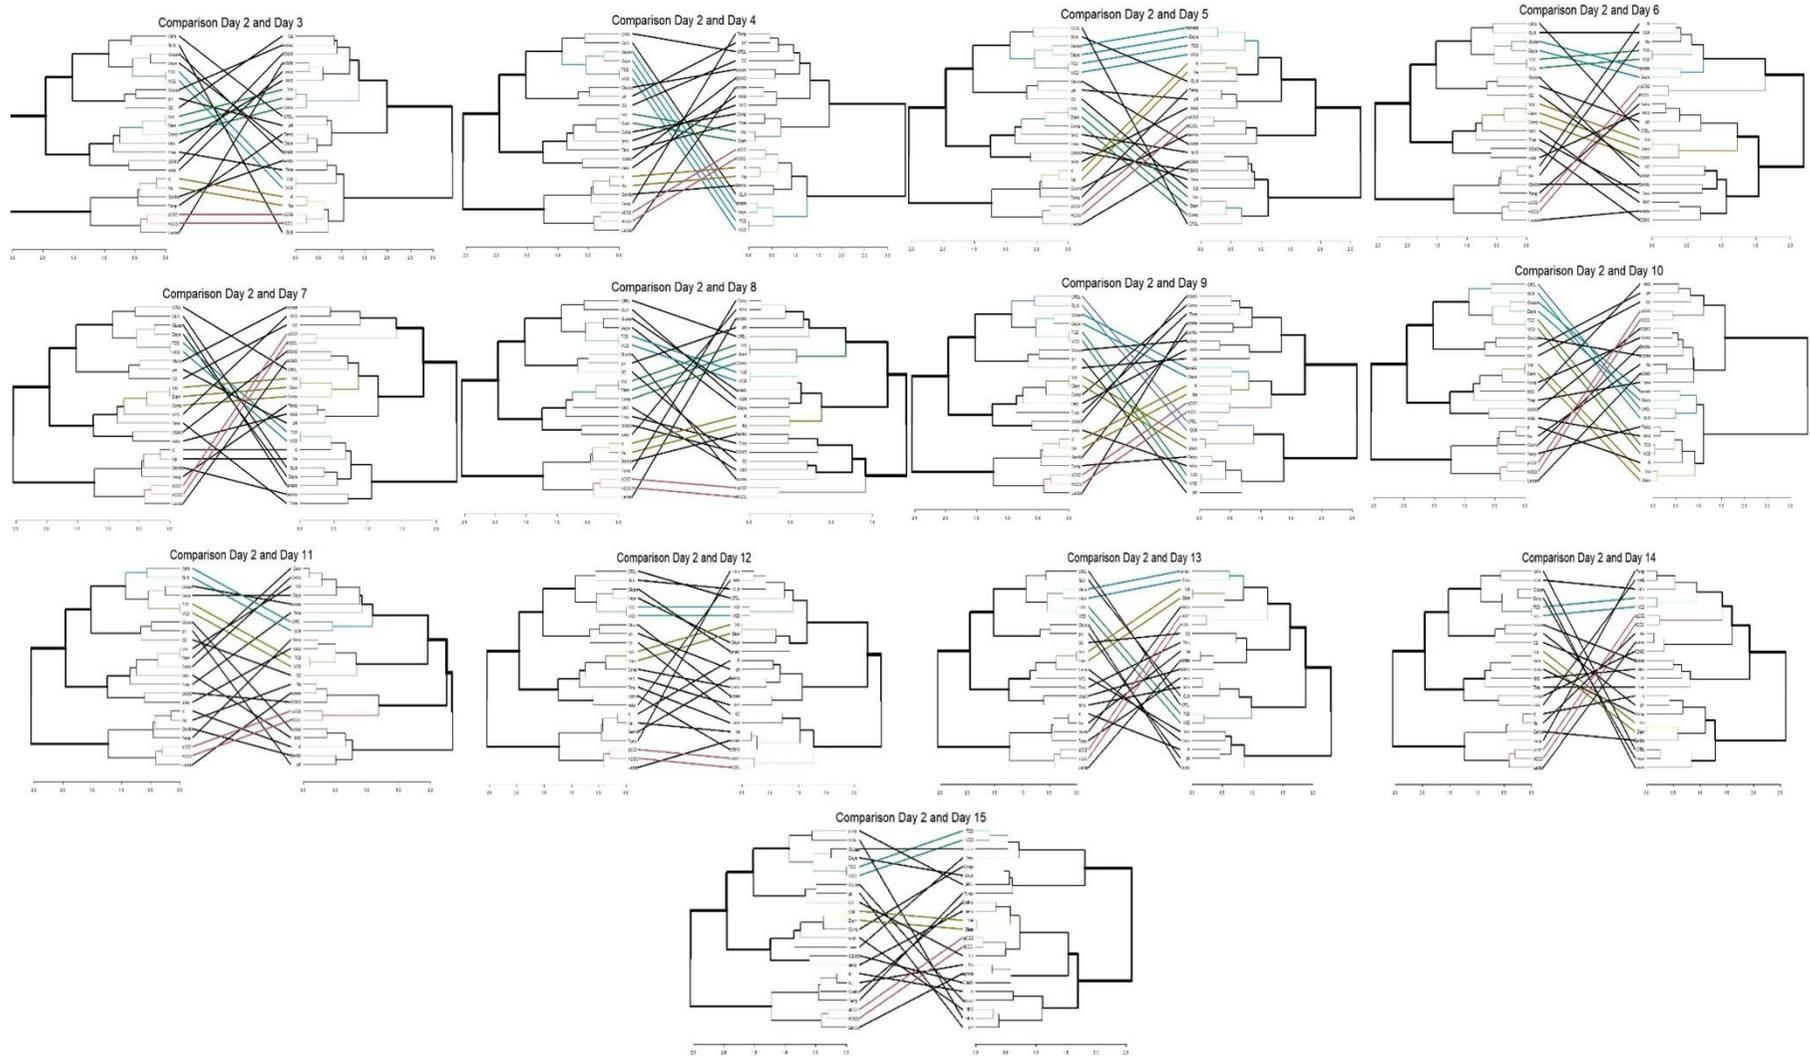

Figure 32: Tanglegrams for comparison of parameter clustering on Day 2 with the remaining 13 days of culture. Refer to the explanation above.

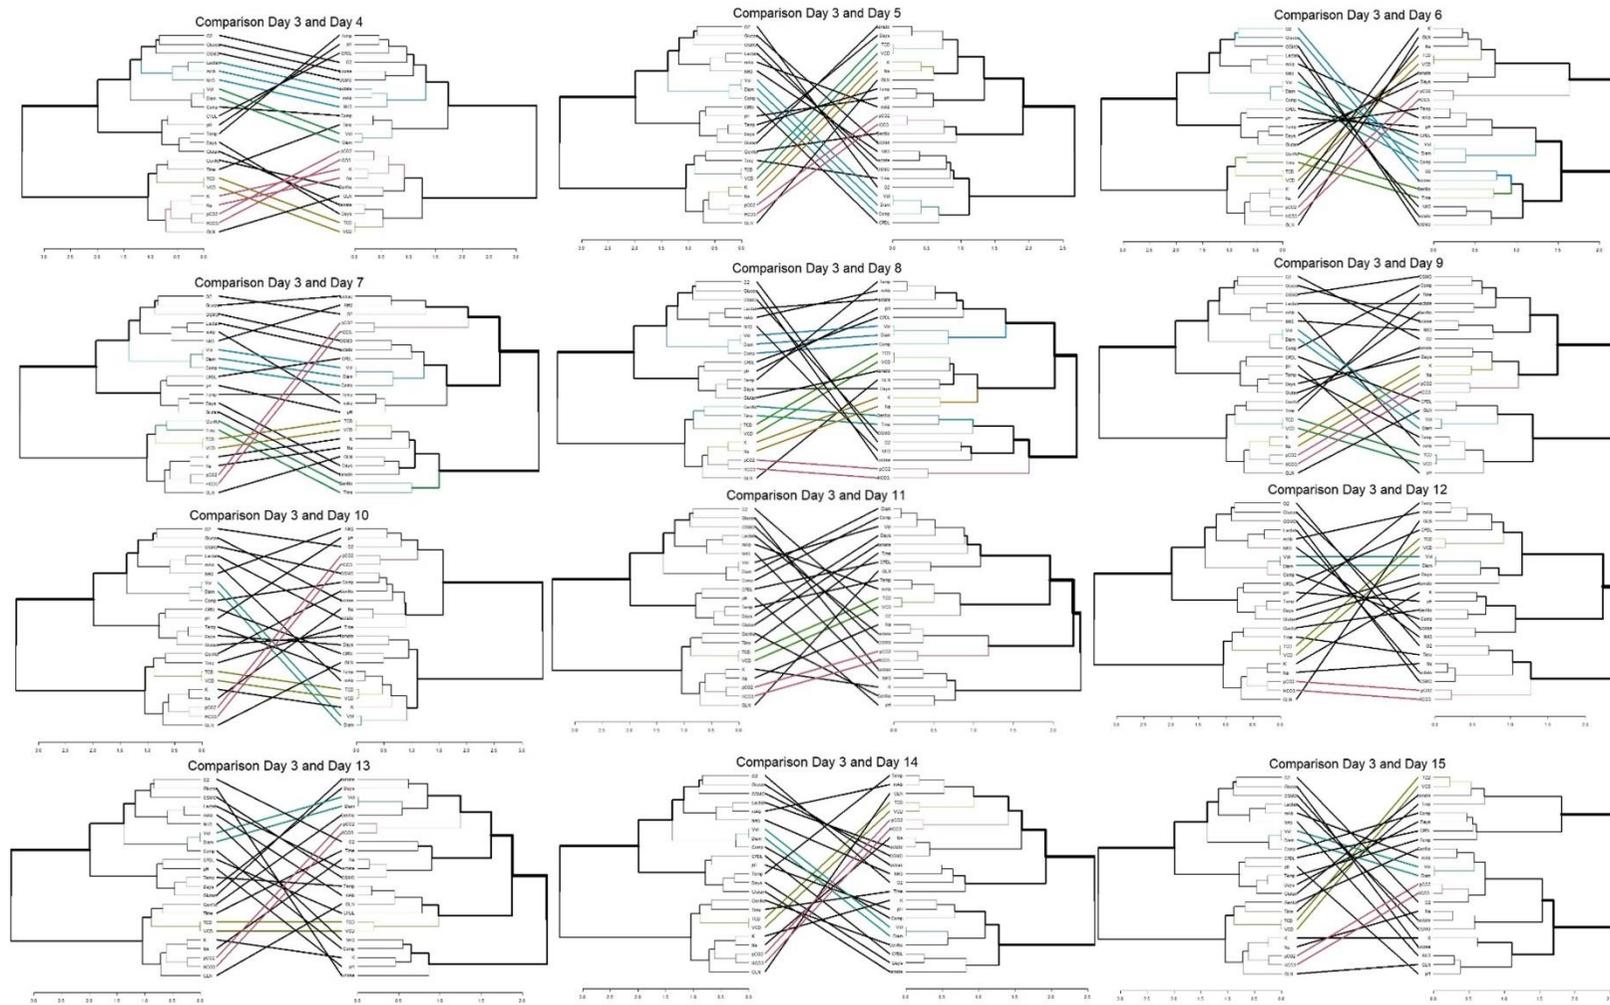

Figure 33: Tanglegrams for comparison of parameter clustering on Day 3 with the remaining days of culture. Refer to the explanation above.

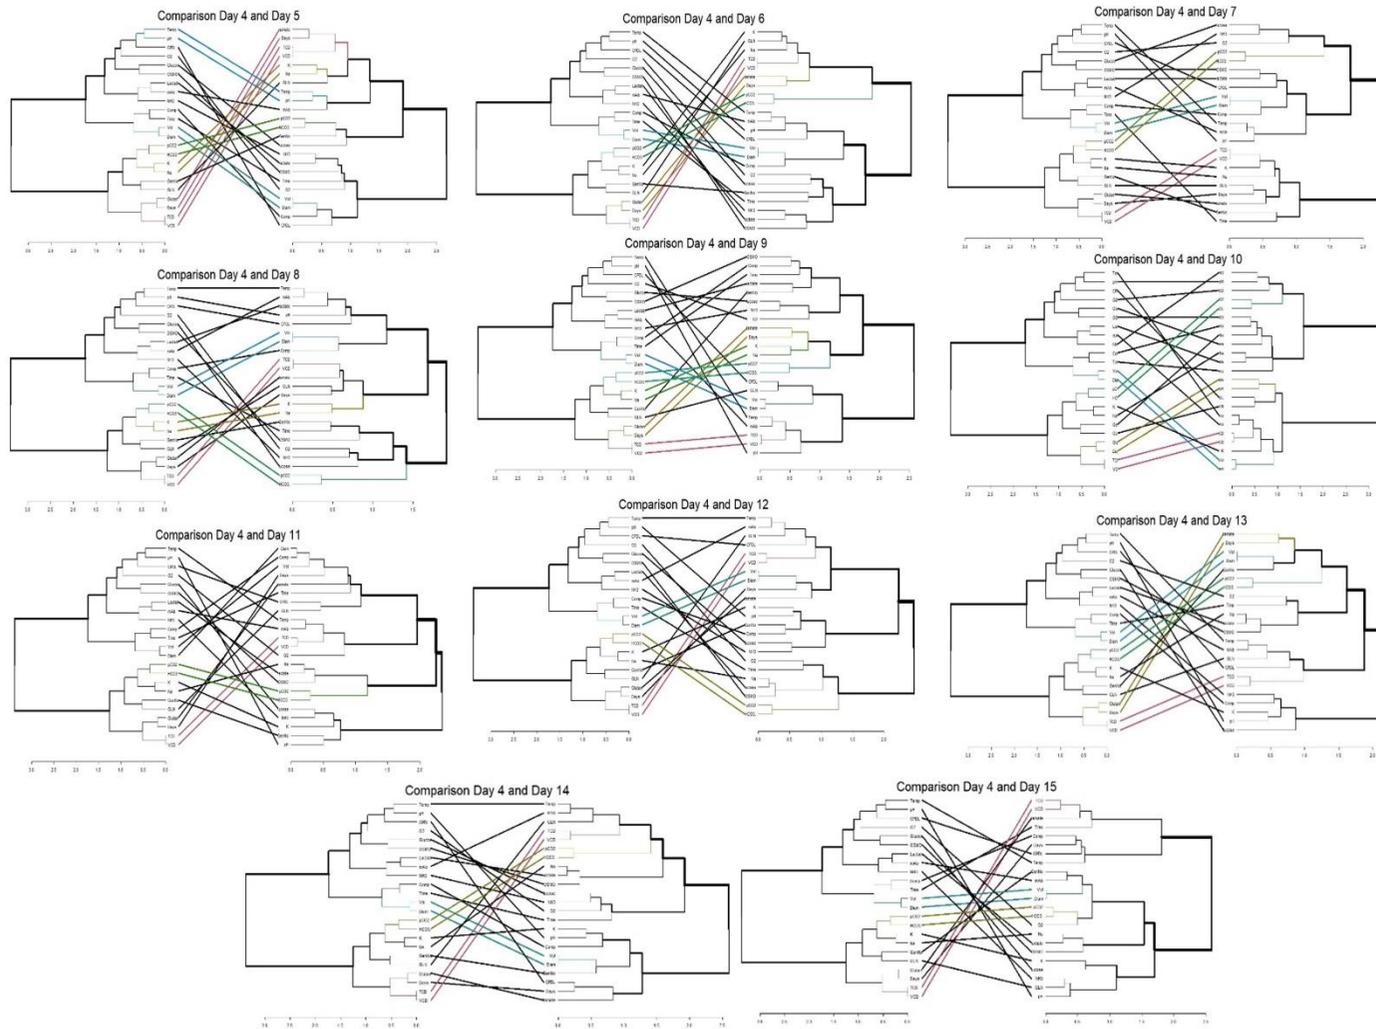

Figure 34: Tanglegrams for comparison of parameter clustering on Day 4 with the remaining days of culture. Refer to the explanation above.

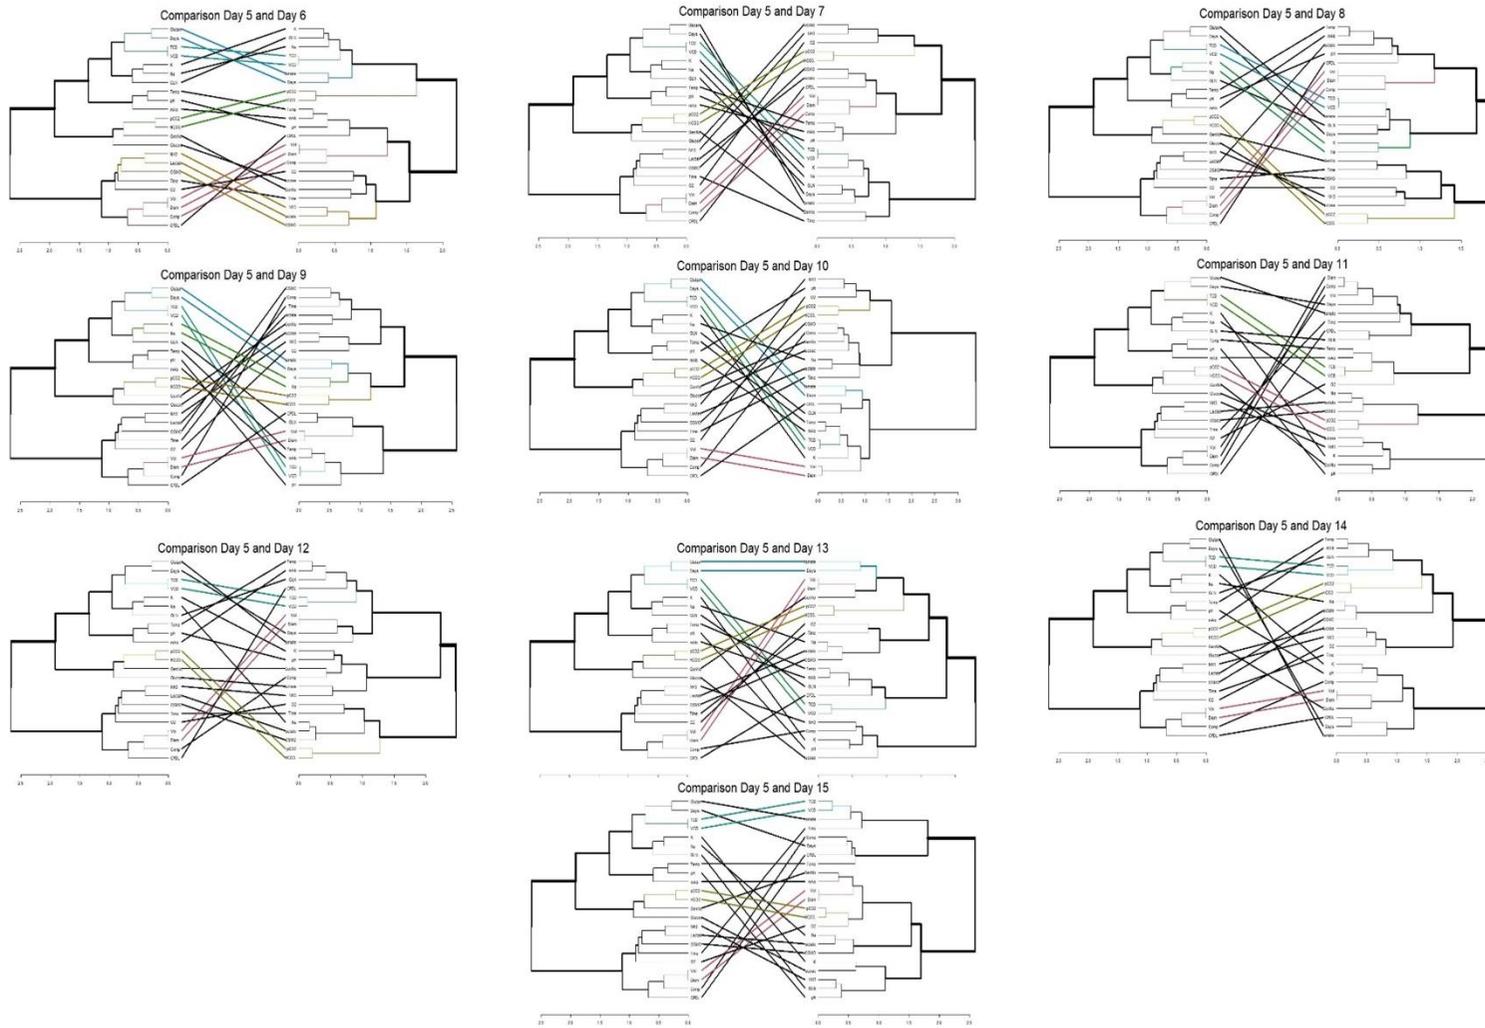

Figure 35: Tanglegrams for comparison of parameter clustering on Day 5 with the remaining days of culture. Refer to the explanation above.

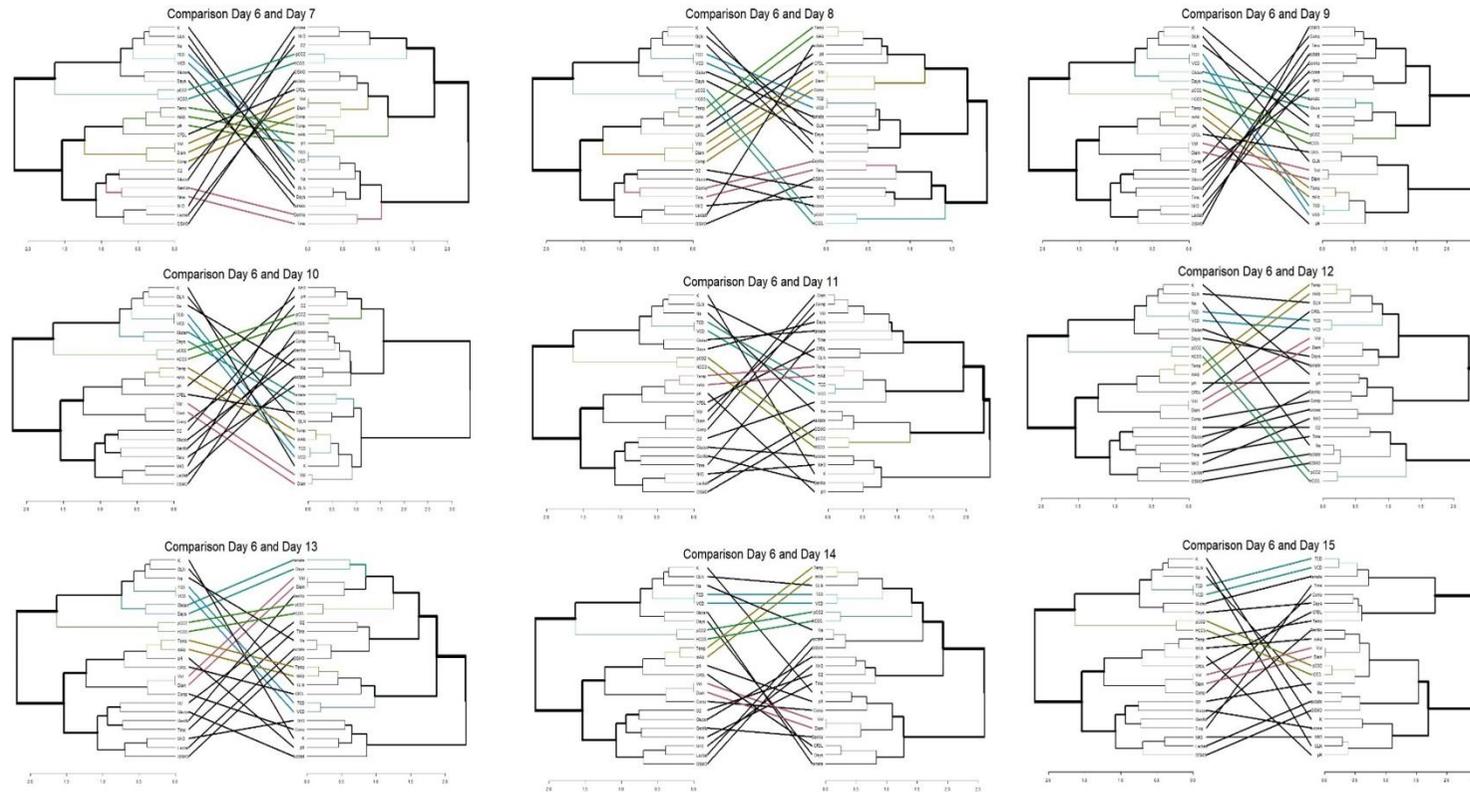

Figure 36: Tanglegrams for comparison of parameter clustering on Day 6 with the remaining days of culture. Refer to the explanation above.

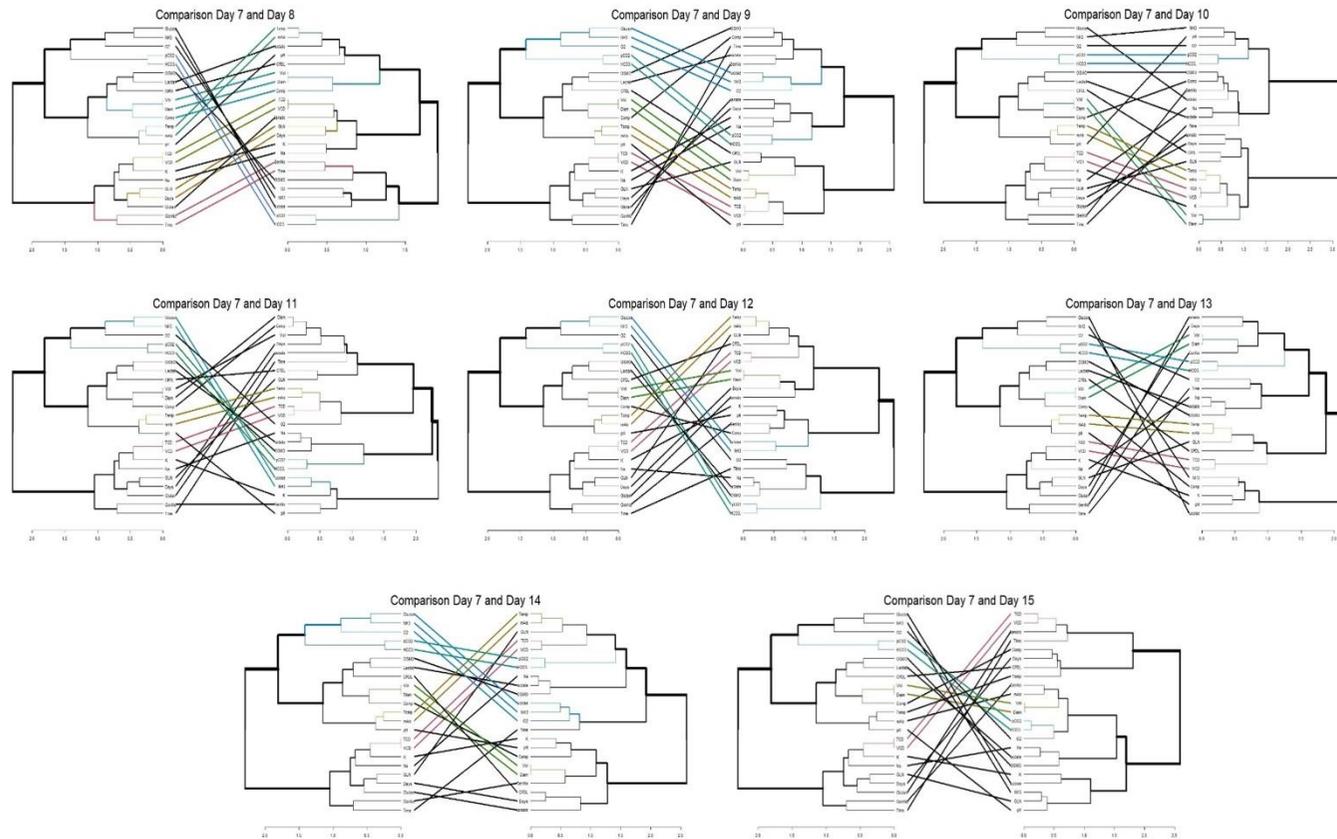

Figure 37: Tanglegrams for comparison of parameter clustering on Day 7 with the remaining days of culture. Refer to the explanation above.

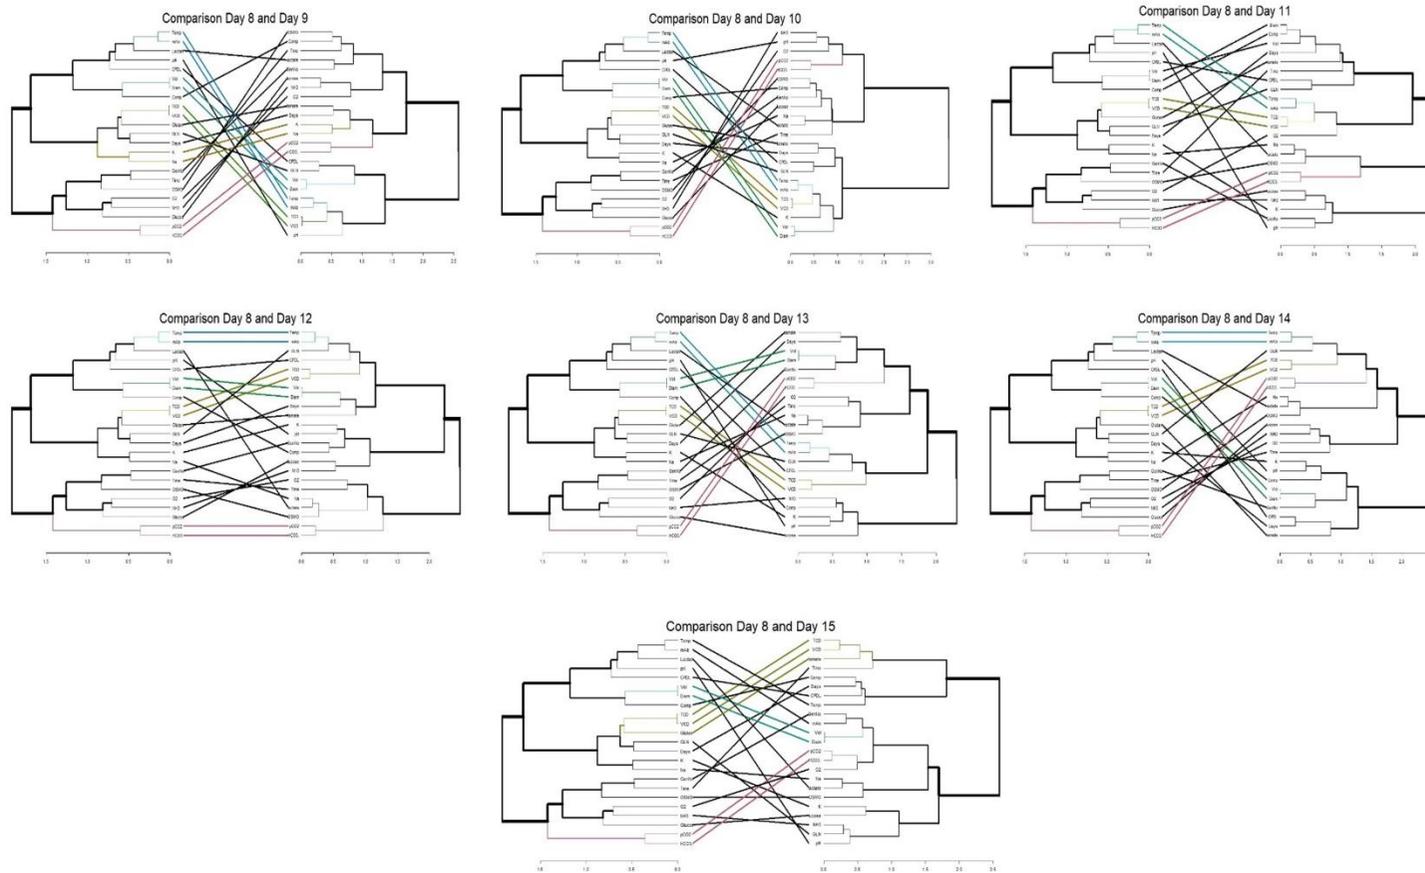

Figure 38: Tanglegrams for comparison of parameter clustering on Day 8 with the remaining days of culture. Refer to the explanation above.

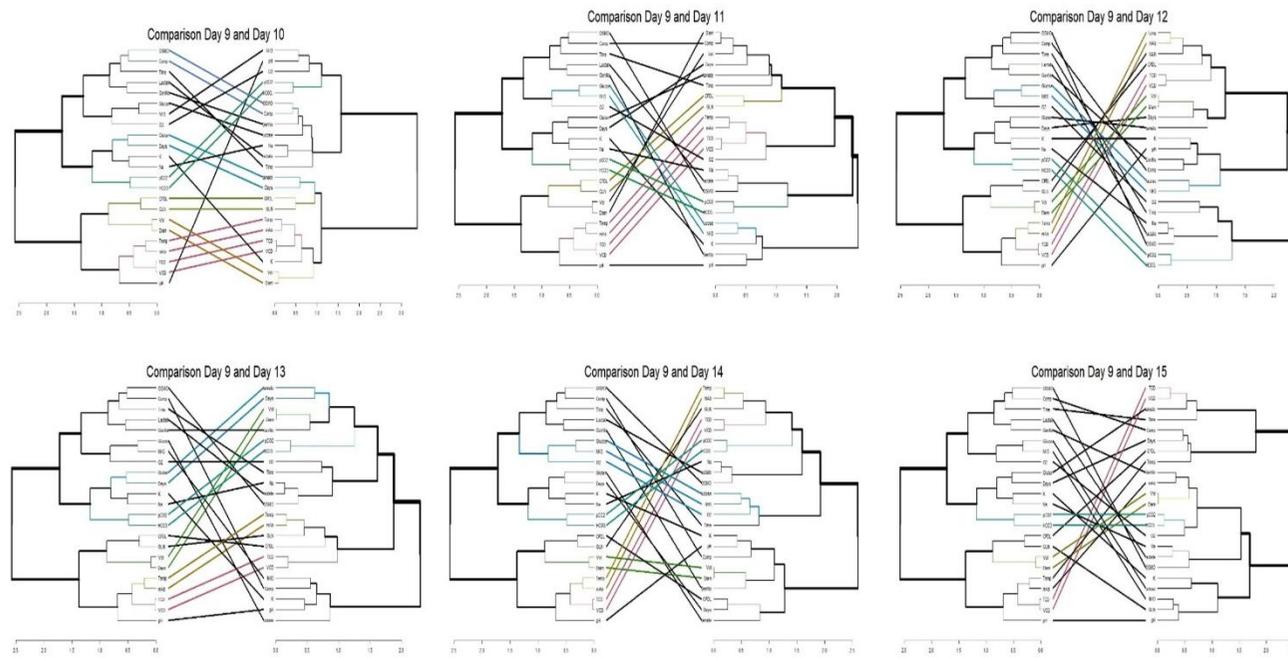

Figure 39: Tanglegrams for comparison of parameter clustering on Day 9 with the remaining days of culture. Refer to the explanation above.

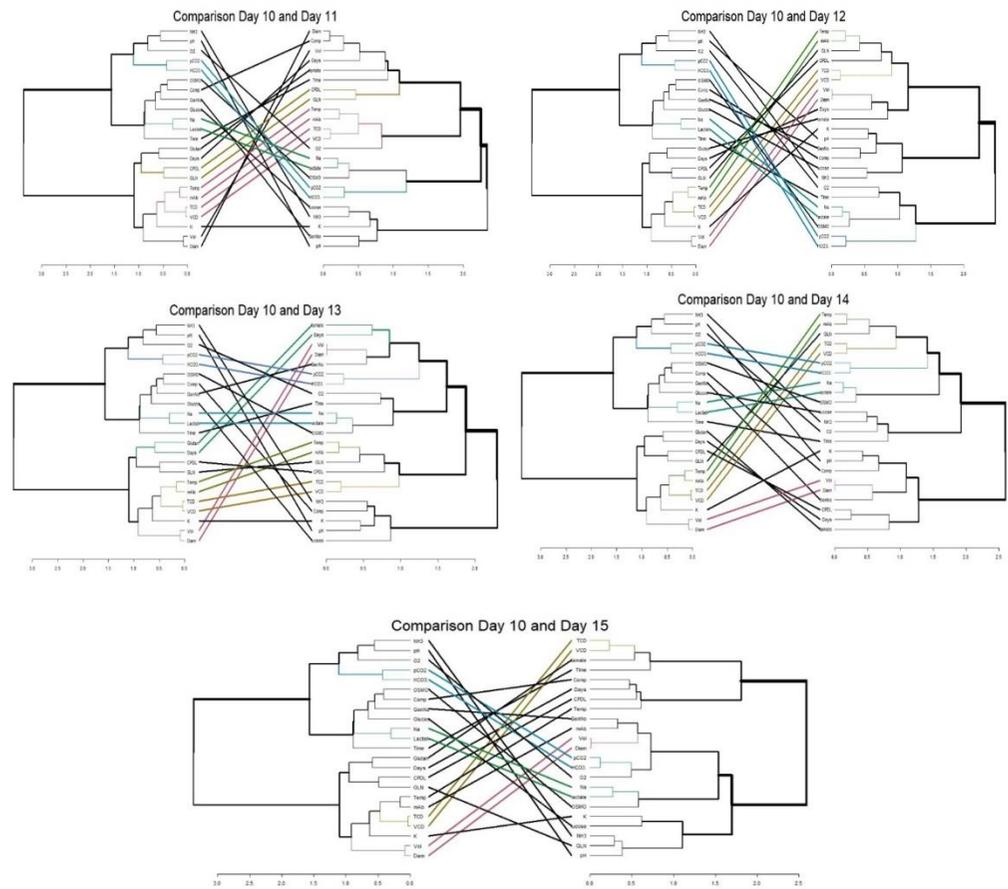

Figure 40: Tanglegrams for comparison of parameter clustering on Day 10 with the remaining days of culture. Refer to the explanation above.

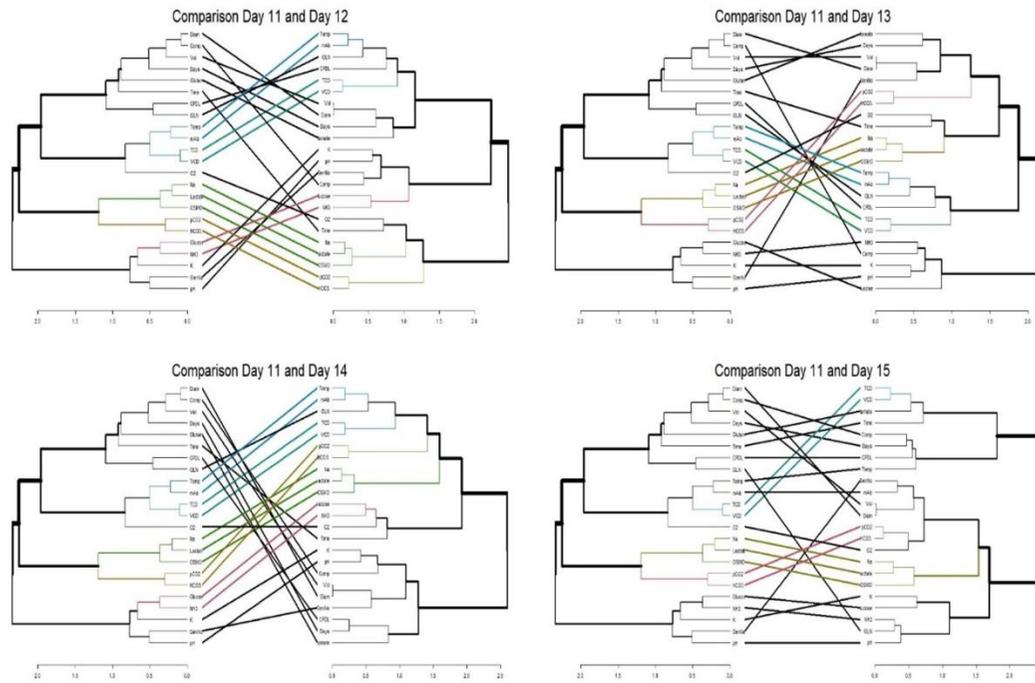

Figure 41: Tanglegrams for comparison of parameter clustering on Day 11 with the remaining days of culture. Refer to the explanation above.

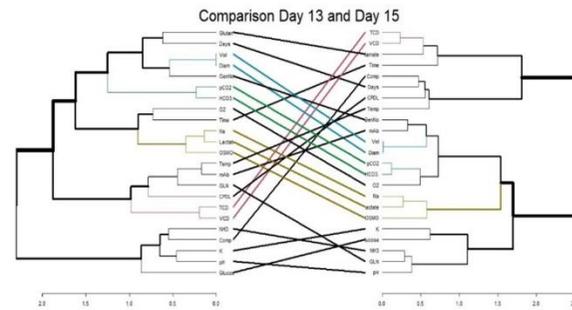

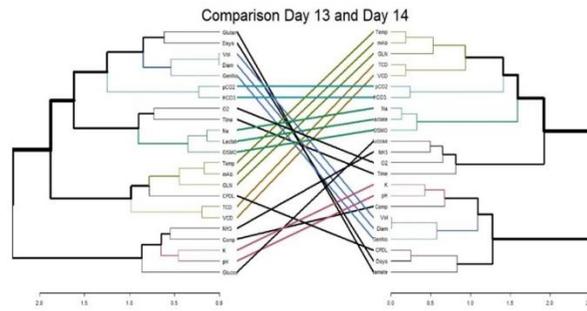

Figure 43: Tanglegrams for comparison of parameter clustering on Day 13 with the remaining days of culture. Refer to the explanation above.

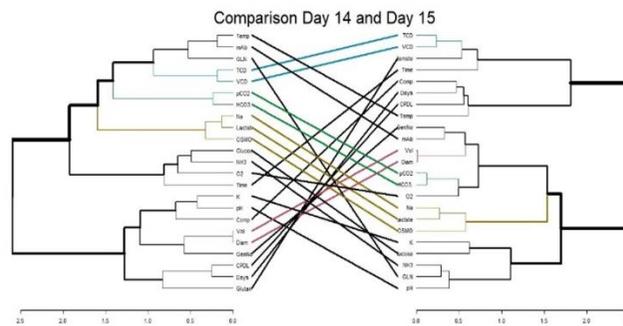

Figure 44: Tanglegrams for comparison of parameter clustering on Day 14 with the remaining days of culture. Refer to the explanation above.

Appendix IV

1. Plots generated by different algorithms used for feature selection.

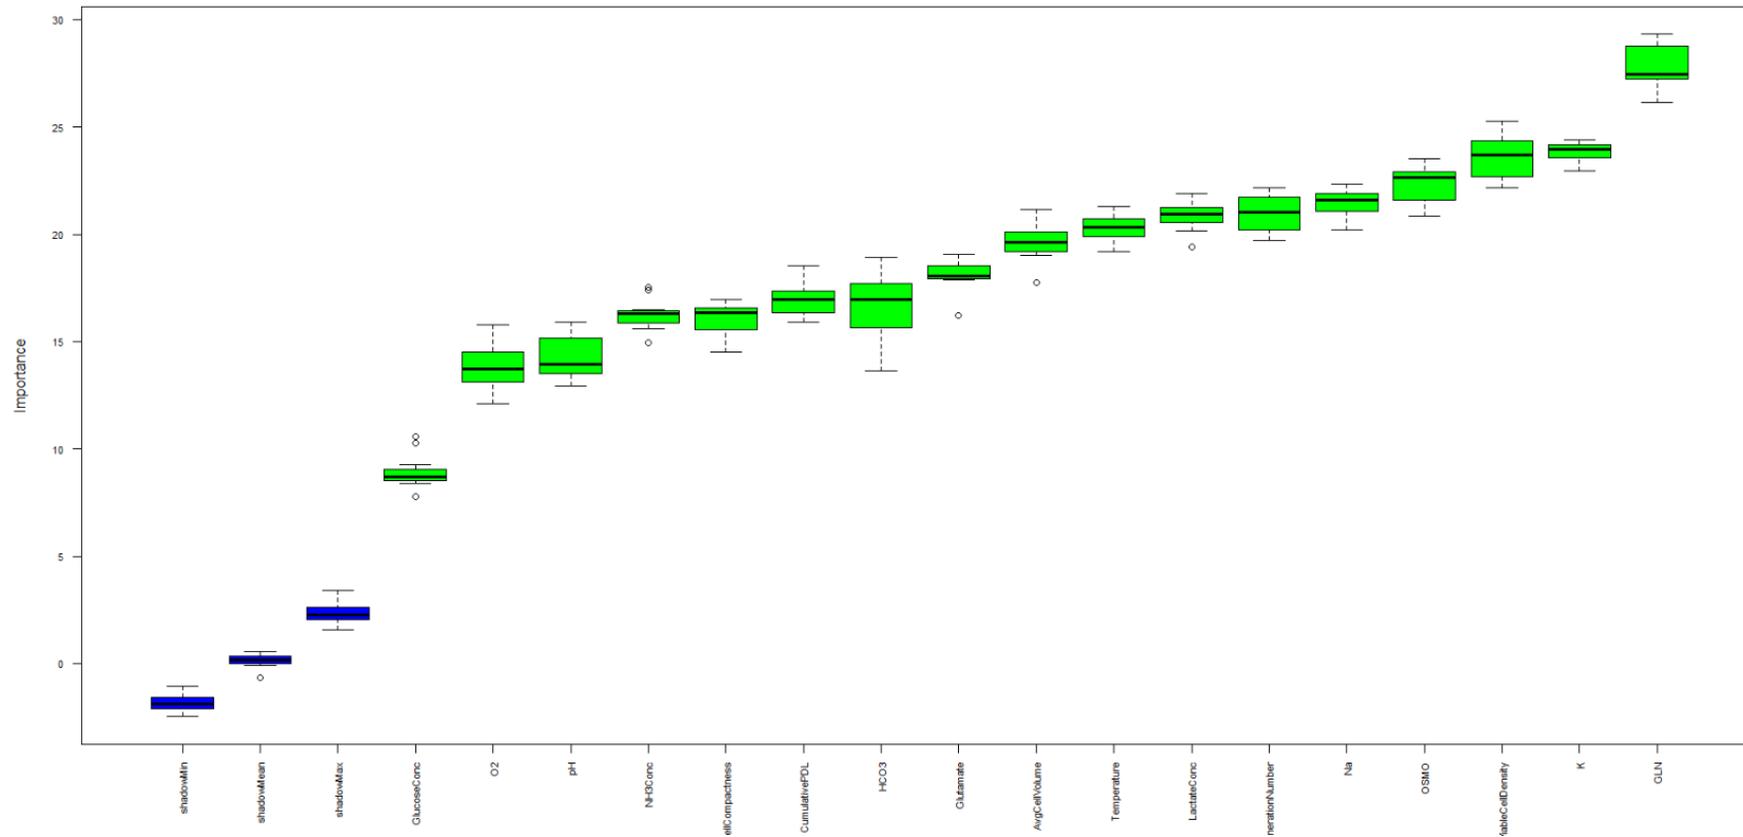

Figure 1: Parameter importance as calculated by Boruta algorithm. X axis shows the parameters and Y axis shows their importance. Importance is measured by mean decrease in accuracy of prediction using a model with the parameter incorporated. Axes have no units. Blue boxplots correspond to minimal, average and maximum Z score of a shadow attribute. Green boxplots represent Z scores of confirmed attributes.

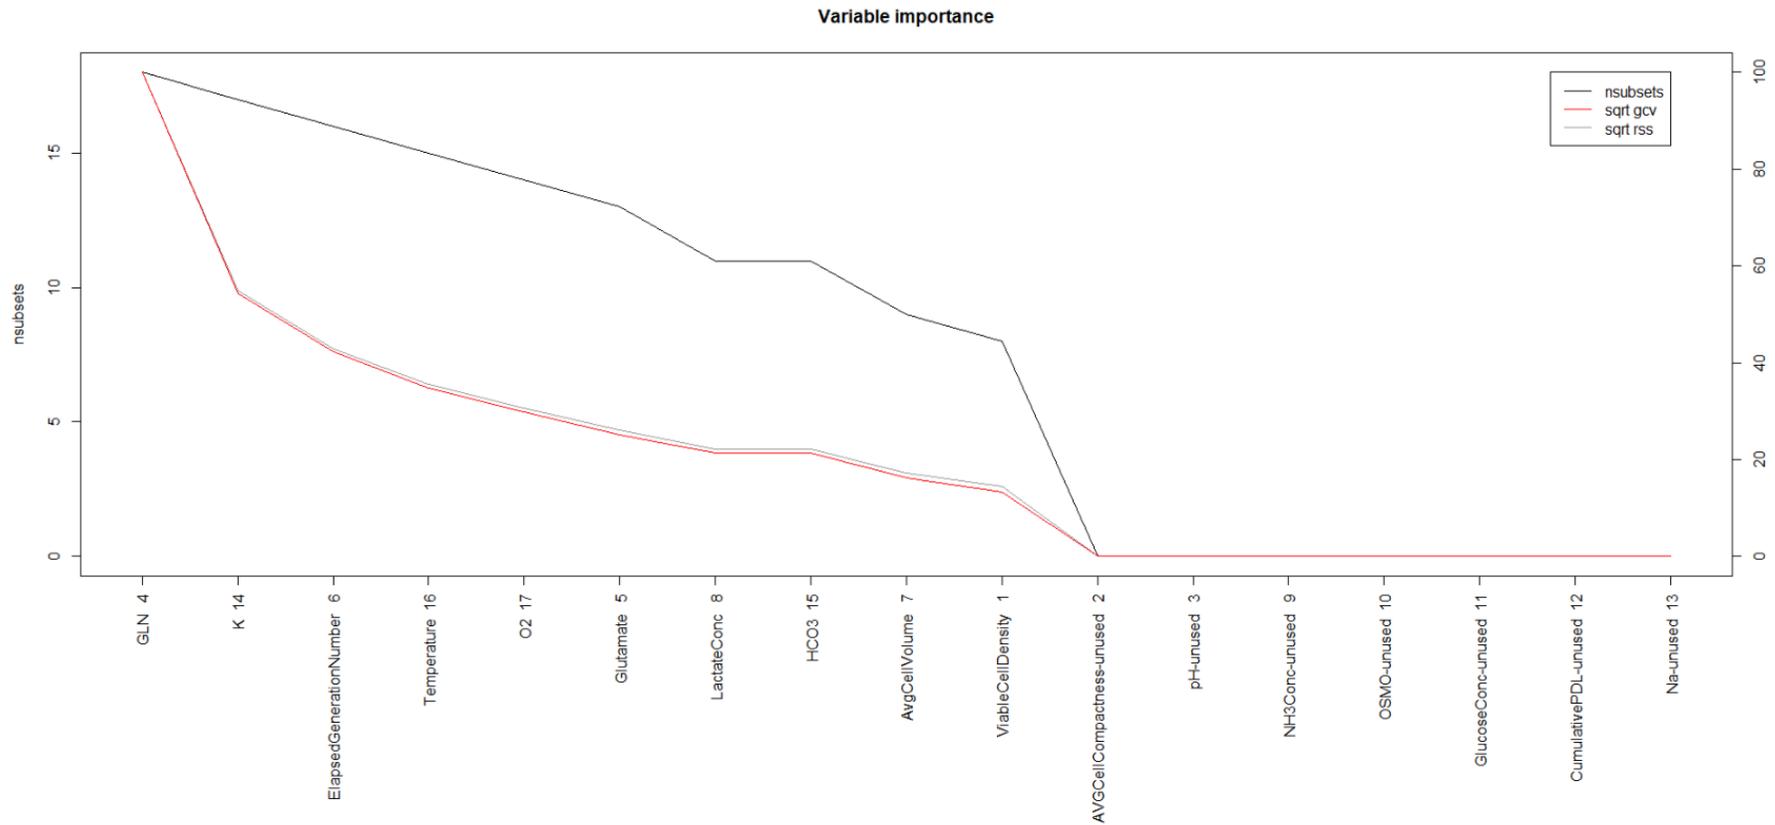

Figure 2: Parameter importance as predicted by MARS. X axis shows the different parameters, Y axis on the left shows nsubsets, which is the number of subset models in which the parameter occurs, and Y axis on the right shows GCV and RSS values. Moving from top to bottom on the left Y axis, the number of subset models in which the parameter occurred decreases, and hence the parameter importance decreases. Red line represents Generalised Cross Validation (GCV), Grey line represents Residual Sum of Squares (RSS) and Blue line represents value of nsubsets for each parameter. Axes have no units.

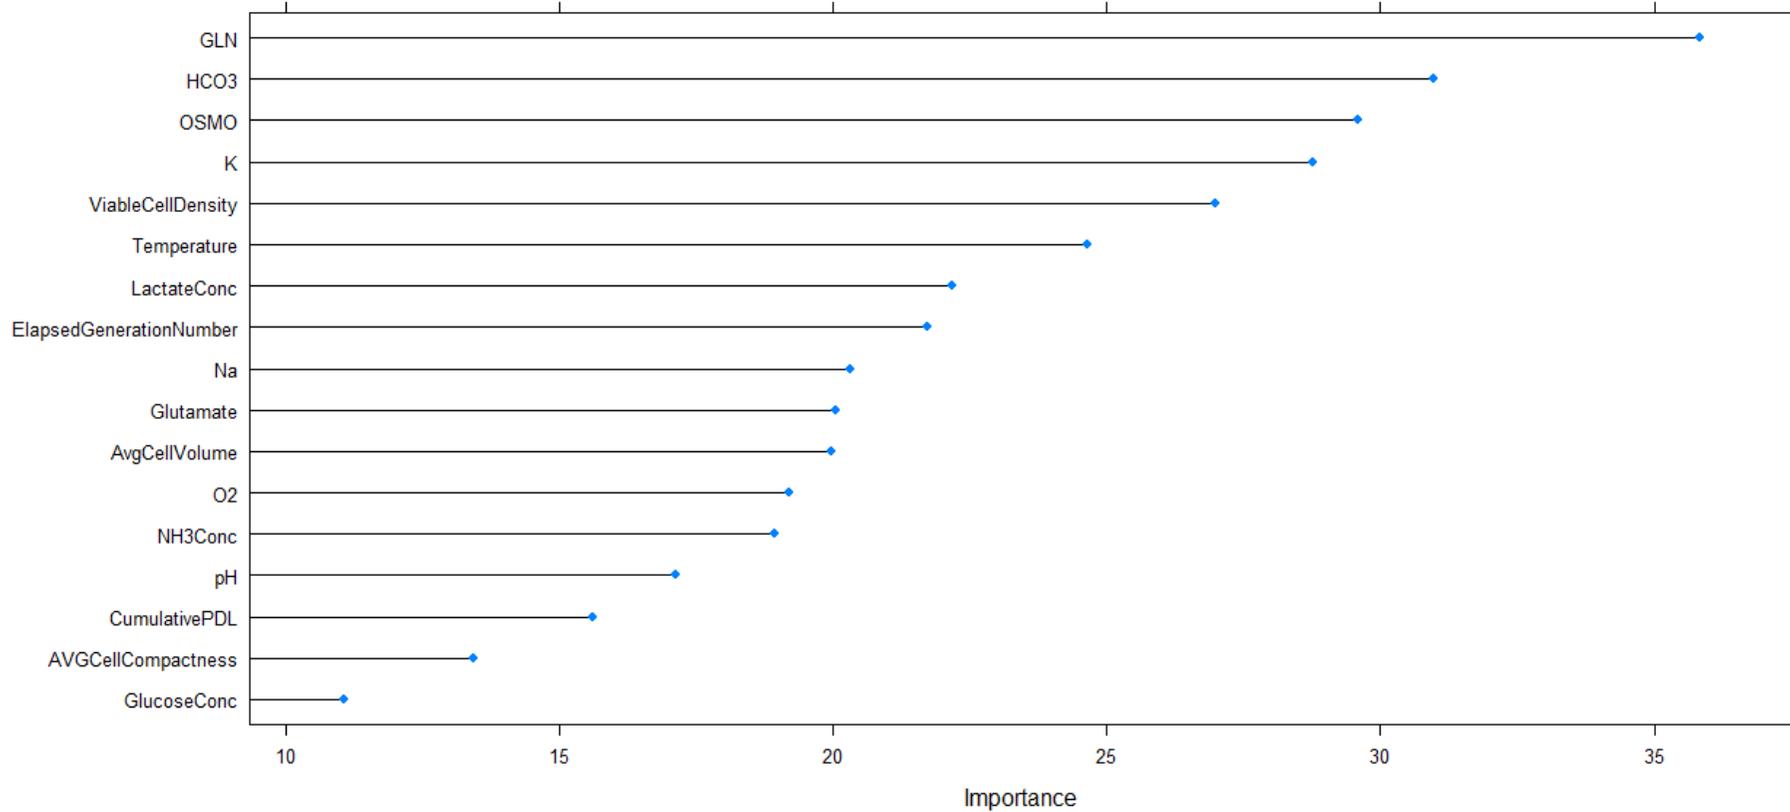

Figure 3: Parameter importance as predicted by parRF. X axis shows the importance and Y axis shows the different parameters. Moving from left to right on X axis the importance increases. Importance scores are aggregate measures that quantify the impact of the predictor (All importance measures are set to have a maximum value of 100 in R). Axes have no units.

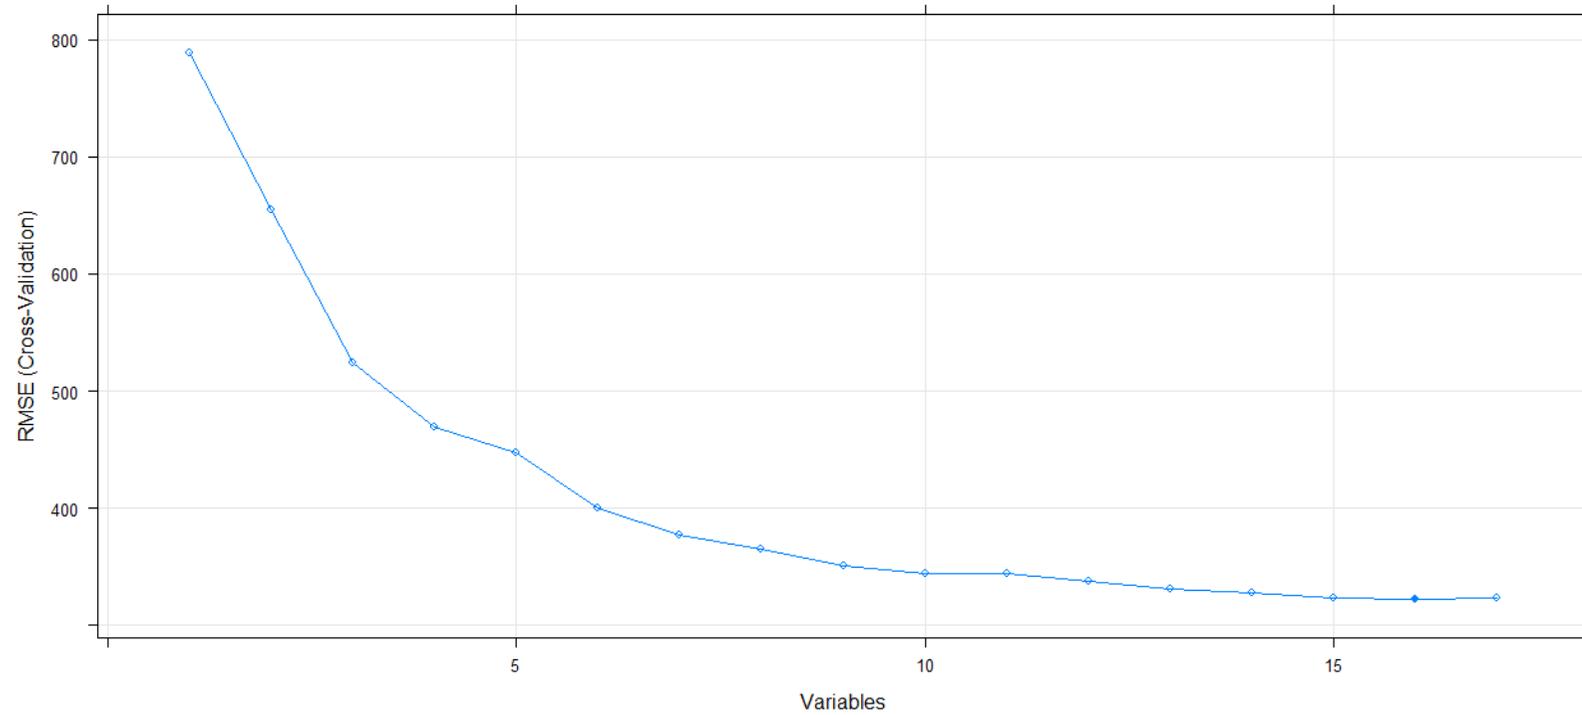

Figure 4: Decrease in cross validation RMSE with increasing number of parameters employed in prediction using RFE. X axis shows the number of parameters and Y axis shows the RMSE of prediction. RMSE has the same value as response variable. In this case mAb concentration (mg/L). Moving from top to bottom on Y axis RMSE value decreases.

Appendix V

1. Table showing prediction RMSE for the first dimension models, using a training set comprised of randomly selected 70% of the complete dataset, and a test set, which corresponded to the remaining 30% of the complete data. Alphabets in the table corresponds to parameters : [Glutamine]-A, [K⁺]-B, Osmolality-C, VCD-D, Temperature-E, EGN-F, [Lactate]-G, [Glutamate]-H, ACV-I, [HCO₃⁻]-J, [Na⁺]-K, CPDL-L, ACC-M, pH-N, [NH₃]-O, pO₂-P,[Glucose]-Q, [mAb]-R. Values in red indicate the earliest days on which prediction RMSE is low. Values in blue represent RMSEs lower than red, but are far ahead on culture days.

Table 1: Prediction RMSE for the first dimension models

| Parameter | Day0 to 1 | Day0 to 2 | Day0 to 3 | Day0 to 4 | Day0 to 5 | Day0 to 6 | Day0 to 7 | Day0 to 8 | Day0 to 9 | Day0 to 10 | Day0 to 11 | Day0 to 12 | Day0 to 13 |
|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|------------|------------|------------|------------|
