Table 2: Concurrent validity, convergent validity, and predictive validity of the two dependency algorithms. <sup>a</sup>4.5 years in ICICLE-PD. <sup>b</sup>Adjusted difference represents the difference in score between dependent and independent as defined by the algorithm, adjusted for age and sex. A positive difference in PDQ-39 score indicates worse quality of life, a negative difference in MMSE indicates poorer cognition and a positive difference in UPDRS part 3 indicates a more severe motor impairment in those who are dependent. Abbreviations: CI = confidence interval; FN = false negative; FP = false positive; HR = hazard ratio; MDS-UPDRS = Movement Disorder Society revision of the Unified Parkinson's disease rating scale; MMSE = mini-mental state examination; PDQ-39 = Parkinson's disease questionnaire – 39 item; S&E = Schwab & England; TN = true negative; TP = true positive; UPDRS = Unified Parkinson's disease rating scale.
