1. General experimental details

All reactions were performed using oven-dried glassware (200 °C) under an atmosphere of argon unless otherwise stated. Solvents were freshly distilled over sodium benzophenone ketyl (THF, Et₂O) or calcium hydride (CH₂Cl₂, toluene, hexane and EtOAc). Additional anhydrous solvents were obtained from commercial sources and used directly (DMF, DMA). DIPEA and Et₃N were freshly distilled over calcium hydride and stored over 4 Å molecular sieves. All reagents were obtained from commercial sources and used without further purification. °BuLi was titrated prior to use with BHT and 1,10-phenanthroline as indicator.

Flash column chromatography was performed using high-purity grade silica gel (Merck grade 9385) with a pore size 60 Å and 230–400 mesh particle size under air pressure. Analytical thin layer chromatography (TLC) was performed using silica gel 60 F₂₅₄ pre-coated glass backed plates and visualized by ultraviolet radiation (254 nm) and/or potassium permanganate solution as appropriate.

¹H NMR spectra were recorded on either a 400 MHz MHz DPX-400 Dual Spectrometer or a 500 MHz DCH Cryoprobe Spectrometer as indicated. Chemical shifts are reported in ppm with the resonance resulting from incomplete deuteration of the solvent as the internal standard (CDCl₃: 7.26 ppm, s; CD₂OD: 3.31 ppm, qn). ¹³C NMR spectra were recorded on the same spectrometers with complete proton decoupling. Chemical shifts are reported in ppm with the solvent resonance as the internal standard (¹³CDCl₃: 77.16 ppm, t; ¹³CD₂OD: 49.00, septet). ¹⁹F NMR spectra were recorded on a 376 MHz Avance III HD Spectrometer. Chemical shifts are reported in ppm with CFCl₃ as the external standard (CFCl₃: 0.00 ppm). Data are reported as follows: chemical shift δ/ppm, integration (¹H and ¹⁹F), multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, qn = quintet, br = broad, m = multiplet or combinations thereof; ¹³C signals are singlets unless otherwise stated), coupling constants J in Hz. ¹H NMR signals are reported to 2 decimal places and ¹³C signals to 1 decimal place unless rounding would produce a value identical to another signal. In this case, an additional decimal place is reported for both signals concerned.

Infrared spectra were recorded neat as thin films on a Perkin-Elmer Spectrum One FTIR spectrometer and selected peaks are reported (s = strong, m = medium, w = weak, br = broad).

High resolution mass spectrometry (HRMS) was performed using electrospray ionisation (ESI) or electron impact (EI) on either a Waters Micromass LCT Premier spectrometer or performed by the Mass Spectrometry Service for the Chemistry Department at the University of Cambridge. All m/z values are reported to 4 decimal places and are within ± 5 ppm of theoretical values.

Specific optical rotation was recorded on a Perkin-Elmer Model 343 digital polarimeter, using a Na/Hal lamp set at 589 nm and with a path length of 100 mm. [α]D values were measured using spectroscopy grade solvent at the specified concentration (in g cm⁻³) and temperature, with units of 10⁻¹ cm² g⁻¹.
2. Synthetic procedures and characterisation

**Trifluoroacetaldehyde oxime (2):** Trifluoroacetaldehyde methyl hemiacetal (1) (10.00 g, 76.9 mmol, 1 eq.) and hydroxylamine hydrochloride (8.00 g, 115.1 mmol, 1.5 eq.) were dissolved in 30% aqueous MeOH (50 mL). An aqueous solution of 50% NaOH (16 mL, 195.1 mmol, 2.5 eq.) was added slowly dropwise via syringe pump over 45 min to the stirred reaction mixture at 0 °C. The reaction mixture was allowed to warm to r.t. and stirred overnight. Hexane (50 mL) was added, the layers were separated and the aqueous layer was acidified with 37% aqueous HCl to pH 6. The mixture was then extracted with Et₂O (2 × 100 mL) and the combined organic extracts dried (MgSO₄), affording the crude title product 2 in Et₂O as a pale yellow liquid and used immediately without further purification.

**Trifluoroacetohydroximoyl bromide (3):** N-bromosuccinimide (15.03 g, 84.5 mmol) was dissolved in DMF (30 mL) and added slowly dropwise via syringe pump over 1 h to the stirred solution of trifluoroacetaldehyde oxime (2) at 0 °C, warmed to r.t. and stirred overnight. The reaction mixture was washed with water (2 × 100 mL), brine (100 mL) and dried (MgSO₄), affording the crude title compound 3 in Et₂O (113.76 g containing 12.40 g of 3, 84% over 2 steps) as a red-brown liquid. A solution of Et₃N (0.42 mL, 0.303 g, 3.0 mmol, 2 eq.) in toluene (1.6 mL) was added slowly dropwise to the stirred reaction mixture via syringe pump over 2 h at r.t., forming a white precipitate. Hexane (25 mL) was added and the white precipitate filtered off. The white precipitate was washed further on the filter with EtOAc (5 mL). The filtrate was washed with water (25 mL), brine (25 mL), dried (MgSO₄), evaporated under reduced pressure and purified by flash column chromatography.

N-hydroxy-4-(trifluoromethyl)benzimidoyl chloride: 4-(trifluoromethyl)benzaldehyde (3.0 g, 17.2 mmol, 1 eq.) and hydroxylamine hydrochloride (1.8 g, 25.8 mmol, 1.5 eq.) were dissolved in MeOH/H$_2$O (3:1, 10 mL). An aqueous solution of 50% NaOH (3.5 mL, 43.1 mmol, 2.5 eq.) was added slowly dropwise via syringe pump over 45 min to the stirred reaction mixture at 0 °C. The reaction mixture was allowed to warm to r.t. and stirred overnight. Hexane (15 mL) was added, the layers were separated and the aqueous layer was acidified with 37% aqueous HCl to pH 6 at 0 °C. The mixture was then extracted with Et$_2$O (2 × 20 mL) and the combined organic extracts dried (MgSO$_4$). The solvent was evaporated under reduced pressure to provide the crude aldoxime. The crude aldoxime (2.56 g, ca. 13.6 mmol) was then redissolved in DMF (15 mL) and cooled to 0 °C. Approximately one-third of N-chlorosuccinimide (2.17 g, 16.3 mmol, 1.2 eq.) was added slowly portionwise, then one drop of 1 N aqueous HCl was added to initiate the reaction. The remainder of the NCS was added slowly portionwise and the reaction mixture stirred further at r.t. for 5 h. Water (100 mL) was added and extracted with EtOAc (3 × 100 mL). The combined organic extracts were washed with water (5 × 100 mL), brine (100 mL), dried (MgSO$_4$) and evaporated under reduced pressure. The residue was purified by silica gel column chromatography (20% EtOAc/hexane) to provide the title compound (2.91 g, 76% over 2 steps) as a white solid, m.p. 87-89 °C.
